A HANDLE of some sort is a very desirable addition to a miniature camera user's equipment. This one is novel inasmuch as it includes a shutter release in such a way as to allow both hands to steady the instrument. What is more, the camera may be held rock-steady and operated in one hand. The high-speed enthusiast will find this a great help. It is very handy for "blind firing," either in a crowd or elsewhere.

It is easily made from any odd scrap of wood about $3 \times 1\frac{1}{2} \times \frac{1}{2}$ in. Whittle it to the shape shown, and then bore a hole along the dotted line. Make this a fairly close fit for your cable release. The usual $\frac{1}{4}$ -in. Whitworth bolt is screwed into the top, which should be covered with felt to protect the camera and give it a grip. The edges may now be rounded off, the sides roughened, and the whole thing polished up.

In use the handle is first screwed on. The release is given a turn anti-clockwise at the screw end before inserting it into its socket. The camera is then ready for use. L. COLLINS.

A TANK HINT.

THOSE who develop their films in a tank know the necessity of having the parts thoroughly dry when loading up. In some tanks the presence of a drop or two of water in a groove will cause the film to stick and so jam in the process of loading. In any case, there is always the danger of a drop of water getting on to the sensitive surface before developer does. In such an event a mark of different density is the inevitable result.

The necessity for having the parts dry in a hurry occurs if one has a number of spools waiting to be developed. Then the interval during which things dry of their own accord on a shelf becomes irksome. If one is the possessor of an electric fan drying can be very much hastened, especially if the air one blows at the details is warm, as from a fire or gas stove. But, of course, there is nothing like an electric hair-dryer for providing a continuous current of warmed clean air for the purpose. With its aid the reel or other inner parts of a tank can be thoroughly dried in a very few minutes, and the development of a second film can be started almost as soon as the first is finished.

G. K. SEAGER.

RENDER UNTO TIM,

you multitude of ticking clocks and watches, the homage that TIM deserves! Your false hands may lie; your brass innards go wrong; your brazen chimes be mute! But TIM is always right—a golden voice, hidden behind a telephone dial, doling out buckets of Greenwich Mean Time day in and day out. As TIM is to the legion of subordinate tempusmeters, so are we to our competitors—but with a difference. Mark you, mes-

sieurs, that some clocks are ahead of, and some behind, TIM; 'tis in this that our analogy plays us false! After all, who?—who, masters?—could be in front of R. G. Lewis, the leading miniaturists, and, mark you, the only all-miniature firm in the world? Where we lead (yes, here it is—old and hoary but true natchee!) there will others attempt to follow! "Try 202 for Service!"

LAZY BONES!

Just because you know that you will get really good negatives by entrusting your work to us, we do not excuse you from attempting your own work. You are, if you are at all like most of the miniaturists we know, capable and clever, and, this being so, there is no earthly excuse for your not carrying out your own work! A Correx tank needs only to be loaded in total darkness—a matter of a minute or so—and after that everything may be done in broad daylight. We suggest that you send to-day for the following comprehensive developing outfit; one, incidentally, that we should choose for our own use. 1.—Correx tank. 2.—Thermometer. 3.—20-oz. Measure. 4.—Stirring rod. 5.—Acid fixing. 6.—Stop bath. 7.—Developer. 8.—Film clips. 9.—Viscose sponge.

The whole of this outfit costs only 34s. 5d. for standard roll-film work, or 36s. 5d. if 36-exposure 35-mm. film has to be developed. Try your hand now at creating pictures on celluloid—and bless us for suggesting it afterwards!

BEAT YOUR WIFE!

Yes, go on! Kick her, belabour her, and generally maltreat her! Why should your poor lens be the only unfortunate to suffer from your ill-treatment? After all, it is quite evident that you ill-treat the latter, because you have not yet given it the benefit of "Summol" treatment! How unkind you are—just for want of investing in a 3s. 6d. "Summol" lens cleaning and polishing outfit, you make your perfectly inoffensive, and rather expensive, objective turn out flat negatives, and negatives lacking definition! Why not reform? Why not let your quality of mercy be unstrained? Why not get a "Summol" outfit?

WE ARE THE WORLD'S ONLY MINIATURE FIRM!

In the several-thousand-poundsworth of miniature cameras that we have available at the moment, there is practically every model of every camera to be found. If what you are waiting for is not shown in the small selection given below, why not write and ask us whether we can meet your requirements? All apparatus is guaranteed, and we should be delighted to take your present miniature in part exchange, and to spread the balance payable over hire purchase.

CHAMPLIN 15

It is now several months since, in pursuance of our usual policy of introducing to our British amateurs any photographic innovation of significance or value, we first marketed Champlin 15 developer in this country. It was not so easy as we at first thought it would be to make up the developer in concentrated solution to give the results that Harry Champlin himself achieves, but the solution we are marketing at present is a faithful reproduction of the American formula, and no inferior-base chemicals are used at all. The price for each bottle, containing enough solution to make 20 ounces of the developer, is 4s. 9d. and postage costs 6d.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

A Miniature Studio By J. A. NORDBERG.

WHEN, a short while ago, I moved from a fairly large house in the suburbs to a small town flat, and wished to continue my favourite form of photography (i.e., portraiture) I found that there was not such a thing as a spare room or attic that could be converted into a studio. This was rather a set-back, as I dislike converting an

Shelves capable of bearing the enlarger lamphouse when it is used as a spotlight have been erected both in front of and behind the sitter. When used behind the sitter cinematic lighting effects are quite easily produced. There are two other lights in use—both made from small tin boxes with adjustable slit for the bulb-holder—i.e., the bulb towards the front of the reflector widens the beam and *vice versa*. Fixed to the back of these reflectors are wire loops which hang on hooks that are screwed into the wooden walls of the studio in different positions. If there does not happen to be a hook in the place where I want the light, then I put one there, as it does not matter what is done to the studio.

Accessory Equipment.

As for backgrounds, old sheets or curtains and different coloured crêpe paper pinned to the back wall

THE MINIATURIST.

ordinary room into a "studio" for an evening and then returning it to its normal use (having once tried it) for a variety of reasons, of which having to clear up afterwards is perhaps the strongest.

However, one day, upon realising that there was some sort of small yard behind the block of flats, an idea came to me. After the necessary permission had been obtained, a small, a very small shed arrived, and was put up in the yard.

A Dark-room as well.

The actual dimensions of the shed are only $6 \times 4 \times 6\frac{1}{2}$ ft., but nevertheless, even in this small erection, it is quite possible to produce head-and-shoulder portraits quite indistinguishable from pictures taken in bigger and better surroundings. I have now found that by covering the window it is possible to change this versatile building into a dark-room that is perfectly safe for bromide paper (my developing is done in a "Correx" tank that is loaded, for want of a better place, under the bedclothes), the enlarger when the projecting lens is removed making a very efficient spotlight.

LOW-KEY PORTRAIT.

Taken by A. H. B. Dunstan in the studio described.

are very efficient. Electricity is brought by means of an all-weather cable from the back window of the flat, and as the studio is so small it is very seldom necessary to use Photo-flood bulbs, owing to the great reflection from the walls. Inside the studio the cable is connected via fuses to five switch plugs, one for heat (it is often very cold in the studio in

CENTRE. View of interior from the model's end.

BELOW. Interior as seen by the photographer.

THE STUDENT.

winter until the lights have warmed it up), one for the ordinary light, and the remaining three for the studio lights already described.

Of course, as it is so cramped, I do

not ask anybody at all important or bad-tempered to pose in the studio. However, I find that the most obliging models are my close friends, who, now that they have seen one or two results, are not quite so reluctant to sit as they were before, and of course people similarly interested in photography who appreciate the difficulties.

When I first started using this ultra-small room for taking portraits, I used a $2\frac{1}{4} \times 3\frac{1}{4}$ size camera, and although several successful portraits were made with this, the small depth of focus was a great drawback and caused me to change first to $2\frac{1}{4} \times 1\frac{1}{8}$, and finally to 35-mm. size. With the last-named size a coupled range-finder, an f/3.5 lens which allows me to dispense with tripod and use instantaneous speeds, great depth of focus and small size of actual camera make it a very suitable instrument under these conditions.

The advantages of this type of studio over an ordinary room that is converted for one evening only are many. First, lights can be left as they are with no clearing up to be done; (this very fact often preventing their being brought out); secondly, things can be screwed to the walls; thirdly, the easy adaptation to

SELF-PORTRAIT.

a dark-room, as well as many other smaller advantages.

The cost of the whole outfit, including shed, electrical fittings, blind for window, etc., was about £4.

Care of the Miniature Enlarger

By
CHARLES GOLIATHY.

Specks of dust or rust from the mechanism may easily cause trouble.

FROM time to time every worker experiences a crop of one or other kind of trouble. The writer has had many of these troubles brought to him with a request for explanation, and one of the most curious things about solving photographic trouble-problems is that so many apparently similar diseases can arise from such entirely different causes. It is that fact which makes the causes of apparently ordinary

worries sometimes extremely elusive.

Dust is one of the things which the miniaturist has continually to guard against, because it is fraught with greater consequence to him than to most other photographers. Whilst the effects of dust are very much alike, one would scarcely look at the cam of an automatic-focussing enlarger when affected with a plague of dust specks. Yet it was such a rusty cam to which at least one such trouble was traced! The fact was that the rustiness caused a jerky movement in adjusting the enlarger, and each jerk dislodged a certain amount of dust which had collected inside the metal body. Some of the dust settled upon the negatives and gave rise to white specks on the enlargements. An occasional spring-cleaning of the apparatus, accompanied by a smear of vaseline on the working parts of the automatic focussing gear, effectively removed the trouble complained of.

Incorrect Lamp.

Another inquirer complained of mysterious patches on his enlargements, especially on big ones from thin negatives. Since the patches were neither sharp-edged nor discoloured it was fairly certain that they were not chemical stains. Moreover, comparison of various prints showed that the marks nearly always came in the middle of the pictures. The casual reader would be quite surprised to know how many cases one finds of a burnt-out lamp having been replaced by one of the kind shown in the illustration, with the maker's imprint on the end. Some enlargers

require an opal bulb; in fact, opal ones are always worth the extra few pence for the even light they give, to say nothing of the decrease in grain reproduction. But in any case it is not a good idea to spoil the detail of the pictures by projecting an out-of-focus image of a trade-mark through them. When it isn't that, the probable cause of similar marks is a few bits of enamel which may have flaked off the inside of the lamp-house and dropped on to the diffusing-glass of the condenser.

The maker's name on the bulb may be enough to cause uneven illumination.

Modern Miniature Cameras

THE V.P. DOLLY MODEL A.

THE particular Dolly camera to which this review refers is a small and compact instrument built to make eight exposures on the standard V.P. spool, each picture measuring 4×6 cm. The overall dimensions of the camera, including such projections as winding-knob and view-finder, are only $4\frac{1}{2} \times 3\frac{1}{8} \times 1\frac{1}{2}$ inches, and the total weight is 14 oz.

The Dolly is a semi-self-erecting camera, in that the baseboard drops when the catch is released, and the camera comes partly open, but a slight pressure on the baseboard is needed to finish the opening process and lock the front securely in position. The direct-vision optical finder flies up automatically as the camera is opened. When locked, the front is completely rigid. In the model reviewed the lens is a Meyer Trioplan of aperture $f3.5$ and focal length 7.5 cm., mounted in a Compur-Normal shutter, speeded to $1/3000$ sec. Focussing in this model is effected by rotating the front cell of the lens, which is scaled to 5 ft., but in more expensive models equipped with Xenar or Tessar lenses a focussing mount, moving the whole lens bodily forward, is fitted.

As Long-focus 3×4 cm. Camera.

A particularly noteworthy feature of the Dolly, which it shares, so far as we know, with no other V.P. camera on the market, is that it can be fitted with a mask for making 16 exposures size 3×4 cm. on each spool, and it is equipped with two red windows in the back for that purpose. This refinement is now quite usual on $3\frac{1}{2} \times 2\frac{1}{4}$ cameras, and has proved extremely

popular with those camera users who have observed that in the majority of exposures made on the full area of the film the real subject only occupies about half the picture space. With its shorter focus lens, the Dolly used as a full V.P.-size camera includes much the same angle as a standard $3\frac{1}{2} \times 2\frac{1}{4}$ camera, so that the reasons leading to the use of the mask in the larger size are just as applicable in the smaller. This feature will particularly appeal to those who have been using a standard 3×4 cm. camera with the usual 5-cm. lens, and have found that they nearly always have to trim away an appreciable portion of an already small negative.

The mask, if required, is put into the camera at the time of loading, and consists of a picture opening complete with runners and rollers replacing entirely the V.P.-size mask, which has to be removed. In this way any chance of upsetting the register or the flatness of the film by adding a mask to an already complete camera-back is avoided. In other respects loading is normal, the spring-loaded film-chambers gripping the spools firmly and allowing them to be inserted or removed readily.

The Dolly camera with the $f3.5$ Trioplan lens described is priced at £5 12s. 6d., but it is available with a Certar $f4.5$ anastigmat, also with front-cell focussing, at £3 17s. 6d. if fitted with delayed-action Prontor shutter, or £5 5s. in Compur-Normal. The models fitted with helicoidal focussing have $f3.5$ Xenar or $f3.5$ Tessar lenses in Compur-Normal shutter, and cost respectively £8 and £11 5s. A companion model of the Dolly, to take plates or film packs in the 4.5×6 cm. size as well as roll film, is also available at a slightly enhanced price. Dolly cameras can be obtained through any dealer, and full details can be obtained from the sole distributors, Messrs. Actina Ltd., 19, Woodstock Street, Bond Street, W.1.

Miniature Camera Gossip

By LANCELOT VINING.

AT one period during the past few days I was afraid that I was going to be a defaulter this week, as a severe "flu" cold reduced my interest in miniature photography to nil.

Although my fears were not quite groundless, I am now able to sit up and take notice, and hope to reach this feature's first birthday on November 10th without missing a week.

As I have not been out and about for a week, my field of operations is very limited, so I had better answer some of the queries which have been held for lack of space.

Where is the promised photograph of the diving sea lion?
Still waiting to be taken. My second visit to the Zoo at night synchronised with a severe rain-storm. I decided to wait another week; on the following Wednesday evening, the last of the season, I was 280 miles from the Zoo, and no flash will carry that distance.

Am I going to continue experimenting with mercury hypersensitising?

Not at the moment, as my experiments produced more fog than extra speed. The wonderful results I used to hear about never seemed to have been part of a

AT THE CASINO DE PARIS: SUNSHADE DANCE.
High contrast of subject subdued by developing in diluted D-76. (Agfa Isopan F film.)

comparative test, which is the only test of any real value. I am still very interested if any real gain can be obtained.

Will I compare the Mendelsohn and Kalart Flash-lamps as soon as possible?

I certainly will, directly I have had some more experience with the Kalart. I think I shall have to ask the Editor to let me do this in a short "special" as it would be too long for these notes.

How do I get soft negatives on Agfa F. using D-76 when the light contrasts are great and artificial?

Give a full exposure and cut down development time. If subject will not stand for this (see sunshine photograph) dilute developer with 50 per cent water.

Tonics.

I heard some months ago that Messrs. Zeiss in Berlin were preparing an exhibition of "Super miniature photographs," and have just heard they want to include my "The Finishing Touch." Another letter was from a man who wants to buy "Cabaret" from the Salon. These news items made me feel better, even though I had to drink a liquid which looked and smelt far worse than stale Champlain 15.

THE FINISHING TOUCH.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

Architecture with a V.P. Camera

By H. W. E. LUFF.

ALTHOUGH for many subjects the inexpensive miniature is at a disadvantage in comparison with a more expensive model fitted with an ultra-rapid lens and a range-finder, this is not the case for architectural subjects. Generally speaking, an elabor-

miseres, and the like, the more elaborate miniature would be of decided assistance on account of the provision of interchangeable lenses. These details are often intended to be seen from some little distance away, and if they are placed above eye-level, too close an approach may involve looking up at them more than the designer intended. To obtain a reasonable-sized image from a distance a long-focus lens is practically a necessity.

Single Lens Results.

But for all ordinary work quite a simple camera does all that is required. Evidence of this is provided by the accompanying illustrations, which were taken in Norwich Cathedral with a V.P.K. purchased seventeen years ago. It has an ordinary single lens, and though the definition at the largest aperture is not up to that of a modern anastigmat, it is at least good enough to make it possible to obtain excellent whole-plate enlargements of architectural subjects, for which it is stopped down to about f/22.

In spite of the lack of rising front, there is very little slope noticeable in the perpendicular lines. What little there is could very easily be corrected, but the prints reproduced here are perfectly straight enlarged reproductions of the original negatives.

THE ALTAR, NORWICH CATHEDRAL.
V.P.K., single lens, smallest aperture. 2 mins. on ordinary film.

ate miniature, which seldom has a rising front, is no better equipped than the simplest models for photographing buildings, and particularly for interiors. Fast lenses are wasted on such subjects, as the depth of focus required necessitates stopping down in any case, and at a small aperture there is no special need for precision workmanship in the camera itself.

All but Special Subjects.

For these reasons the owner of any miniature camera, no matter how modest, can confidently attempt architectural studies of all but the most specialised type. Very tall buildings, involving extreme rise of front as the only alternative to tilting the camera, are best dealt with by a camera of the stand or hand-and-stand variety rather than a miniature of any kind, inexpensive or otherwise. Where a wide-angle lens is needed, the 6×6 cm. camera is probably the best, as instruments of this size are normally fitted with a lens that has a shorter focal length in comparison with the diagonal of the negative than is standard on cameras of any other of the miniature sizes. In practice, however, it is found that the slightly narrower angle of the V.P. or 3×4 cm. camera is wide enough to embrace as much subject as is normally required.

For certain types of architectural detail work, such as might be attempted by a photographer specialising on records of carvings,

THE AMBULATORY, NORWICH CATHEDRAL.
V.P.K., single lens at smallest aperture. 2 mins. on ordinary film.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

PRINTS IN COLOUR.

I would like to make a set of three-colour enlarged negatives from some of my 24×36 mm. colour transparencies with a view to obtaining prints on paper. I have a fairly good idea of how to make the negatives; can you tell me how to make the prints?
S. O. G. (Newcastle-on-Tyne.)

The best advice we can give you is to write to the Autotype Co., Ltd., of 59, New Oxford Street, London, W.C.1, for information and instructions for their three-colour Carbro process. This will give you a good idea of the operations involved.

SHUTTER DISTORTION.

I have read that focal-plane shutters cause distortion. Would you please explain, as this has deterred me from purchasing a miniature so fitted. Press action photographs do not appear to suffer in this way.
E. D. C. (Hastings.)

A focal-plane shutter is a blind in which there is a slit, wide or narrow according to the length of exposure required, and this travels across the film to make the exposure. If you photograph objects which move appreciably during the travel of the blind, the fact that different parts of the film are exposed at different instants can cause distortion. There is none, of course, except on moving objects, and it is never noticeable unless they are moving really fast—and not always then. You are incorrect in saying that press photographs do not show distortion; it is often painfully evident in the elongated wheels of rapidly moving cars.

KEEPING QUALITIES OF D.76.

Being unable to obtain D.76 developer locally, I am making it up myself, but find it troublesome to weigh out all the ingredients before I develop a film. Could I safely make up enough at one time to last me four or five weeks, or would it deteriorate in solution?
E. F. S. (Sidmouth.)

If D.76 developer is made up with water that has been boiled for a short time to expel dissolved air, and is stored in bottles filled to the neck and well corked, you will find that it keeps in excellent condition for a good many months. The same is true of most other fine-grain developers, and is due to the high proportion of sodium sulphite that they contain. But note that the constituents of a developer are spoiled more readily by exposure to air than in any other way; you must therefore take the precautions mentioned to exclude air if the keeping qualities of your solutions are to be satisfactory.

DOUBTS.

I am considering the purchase of a miniature camera taking 16 negatives on a V.P. film, but I am very doubtful of the ability of so small a negative to give good enlargements, even from fine grain film, of so large a size as postcard or half-plate.
A. M. (Sheffield.)

We do not think you should have the slightest difficulty in obtaining excellent enlargements up to sizes much greater than half-plate from any camera taking 16 exposures on a V.P. film. In a recent test of quite an inexpensive camera in that size we obtained some excellent whole-plate enlargements from the tiny negatives.

PERFECT PRINTS.

I enclose two enlargements from V.P. negatives. They were made on a well-known brand of paper and developed in a proprietary developer according to the instructions accompanying it. Apart from the fact that the high-lights are distinctly brown, I am not satisfied with these prints. As I want perfection in every detail, will you please tell me of a paper I could use with satisfaction, together with the appropriate developer? C. A. C. (Manchester.)

There are scores of papers that will give perfect prints, and there is no reason why we should pick out one in preference to all the others. As for the developer for it, you cannot do better than use the formula recommended by the maker of the paper you choose. In some cases these developers are available in packet form. Your main trouble is that your procedure in making the print is seriously at fault. We should doubt very much, for example, whether you thoroughly rinsed the print between developing and fixing, and this alone would be sufficient to account for the stain, while the colour and general appearance of the prints very strongly suggests that they were over-exposed and in consequence under-developed.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDVII.

Dr.
S. D. JOUHAR

From information communicated to our Special Representative.

"GOOD pictures are like good restaurants—you have to go out to find them. Almost every Sunday I start out in my car about four or five in the morning, and when I have reached the selected spot, I tie the car up to a tree, and fare forth on foot, lightly equipped with two Leicas (for portability), accessories and five lenses (for versatility), a cinematograph panoramic tripod (for stability), my private secretary, unpaid, (for compatibility), and I may also carry a $2\frac{1}{4} \times 3\frac{1}{4}$ camera for emergency.

"Thus armed I glide along until I hit upon the wholly satisfactory subject. Here, if the lighting is not right, I sit and wait until it is. If the lighting is right, I make twenty to thirty exposures, and still wait to see if it will get any better.

"I always try to study the composition of a subject, to seize its essential unity, and to concentrate the interest on one point, with perhaps one or two quite subsidiary units repeating in a minor key the theme of the original.

"I believe that the right sort of lines and curves, which are only visible to the esoteric eye, are essential to obtain pictorial and dramatic interest. I believe that the making of good photographs is one of the hardest things in the world, and that only by the exercise of the greatest technical skill and care can they ever be produced. I think that faking is a crime only when it is detectable by the observant.

"I like a variety of subjects—taking portraits in the studio, still-life studies; children, sea, sunsets and windmills in the open. Early morning and late even-

ing are the best times for photography, and then only when the sun shines.

"I always endeavour to select viewpoint and lighting that will so refine and make expressive the outward form that a definite emotional response is created in the beholder of the final picture. This striving for Paterian effect of a beauty wrought out from within that will awaken exquisite passions, always possesses a Gioconda-like elusiveness that is as baffling as it is desirable.

"My pursuit of it has led me to return to a haunt again and again, and sit up working on prints until 'Aurora gilding the morning skies,' in the shape of the milkman dumping a quart of milk on the steps, has reminded me that nights can be shorter than days when riding a hobby horse.

"I use now almost entirely new Agfa F, which I calculate as having a speed of 23° Scheiner. This allows for double exposure time, and six minutes' development in Meritol at 65° Fahr. is given. The time given by the makers renders my negative as harsh as a Victorian grandfather.

"When occasionally using the popular $2\frac{1}{4} \times 3\frac{1}{4}$ size I prefer all-British Nurochrome film. I am gradually abandoning the use of other papers in favour of Gevaluxe. Unfortunately, being wedded to Gevaluxe is nearly as expensive as being wedded to a film star, but the satisfaction is more lasting. My initial prints are all postcard size; these are studied, the best selected, and from perhaps .01 per cent an exhibition print results.

"I would pay tribute to two institutions which have been largely instrumental in any small success I may have had in the way of getting pictures accepted by the London Salon and the Royal. I refer to 'The A.P.', which I read regularly, especially the sections dealing with criticisms of pictorial composition; and to the Hampshire House P.S., where I exhibit regularly in the monthly competitions, as I believe that by this means the standard of work is greatly improved."

(A further example of Dr. Jouhar's work is reproduced on one of the centre Art pages.)

YACHTS AT EASE.

Dr. S. D. Jouhar.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"GOOD NEWS," by John H. Ahern.

APPLYING the criterion advanced last week in our discussion on the page of prints by beginners to the effect that a departure from the normal viewpoint was only warranted when necessitated by the exigencies of the subject and not when adopted simply for the sake of abnormality, this impression, I think, affords a good example of the sort of thing that is permissible.

It is justifiable chiefly on the ground that an equally effective spacing, in the nature of things, could not be obtained from the lower level. The high viewpoint separates and isolates the figures, whereas, from the ordinary point of view, the front row of figures would obscure those in the rear, and no effective grouping—such as here exists—would be possible. There are two groups or sets of figures, the nearer (1) ranging round the figure coming this way, and the more distant (2), centring round the newsboy with the placard. There is a sort of connection between them which makes for unity in the composition, and this is established by the directional impulse suggested by the outside figure on the left of the near group who is walking towards the farther; by a similar impulse started by the outermost figure of the far group who is walking in a line that will bring her into contact eventually with the figures of group (1) who are entering the station; and, on the right, by the line of the canopy over the station entrance.

These factors do much towards making the arrangement effective, and on the arrangement the successful nature of the grouping depends. But, supposing the same subject had been taken at the same time from a viewpoint at the same level as the figures themselves, there would only be a jumbled-up mixture of figures in a hopeless confusion. The three figures on the left of the more distant set might remain as well isolated as at present, provided, of course, that they

were not brought up against something at present excluded which might then conflict with them, but the remainder would be merged into an indistinguishable mass without form or cohesion, and inextricably mixed up with the stall in the rear and the station fittings, while the present useful connection of the canopy would not be availing.

guided individuals becoming aware of the camera and showing it in the usual unfortunate fashion. From the higher standpoint, the chances are more favourable, for, in circumstances such as these, the average person does not notice anything much above his or her level, provided there is little movement and nothing showing against the skyline. Speaking from memory, the

particular viewpoint adopted in this instance is inconspicuous and scarcely noticeable from below, for, from almost any point within the scope of the picture, the photographer would be obscured by fairly high buildings.

But, while he would be able to study his subject more closely than usual, and would be at a considerable advantage on this account, the number of people passing and re-passing at this spot is tremendous, and to secure so successful a grouping would call for a very close attention to the moment for making the exposure, and no fumbling or uncertainty about it when the chance arose.

Otherwise it would go for ever. It would, however, not be wise to rely on one exposure only, no matter how certain it seemed to be that everything was properly caught. It is better far to repeat the effort as soon as another opportunity occurs, or to make a series of exposures and choose the best at leisure afterwards, than to limit the effort to one, for anyone who has done figure or

street scenes of this type will know how often it is that something not previously seen makes an appearance when the negative is developed. Then it is futile to go off at the deep end.

Incidentally, I should have liked to have seen something of a darker tone in the bottom left-hand corner. It does not happen to exist, but, if it did, it would help to balance the weight of tone in the opposite corner above, and though the shadow on the right-hand side is useful, I feel it is not quite enough.

"MENTOR."

So it would seem that the chances are that there would be no subject at all from the ground level, or alternatively, if a subject were possible, it would have to be very differently grouped and the same set of figures could scarcely have been used.

From the lower level, however, the photographer would be working at a very considerable disadvantage inasmuch as, at so short a viewing distance, it would be very difficult indeed to manage to get a group or collection of groups without one or more mis-

PICTURES by Novices

*SOME CRITICAL COMMENTS on
the Beginners' prints reproduced on the opposite page.*

UNLESS there is something out of the ordinary about it, it is difficult to treat a subject like No. 1 of the prints reproduced on the opposite page—"Ferry-side," by P. E. Stanley—so that it acquires a pictorial, as distinct from a topographical, appeal.

The Topographical Element.

It gives me the impression that it has been taken from a passing boat either with the intention of providing a souvenir of the occasion or simply as something to do to relieve the monotony of the voyage. It is technically sound, and, no doubt, serves a purpose in illustrating the topographical features of the place, but with such a purpose I have nothing to do.

What I want to see in these prints by beginners is the intention to make a picture—something that has an interest apart from the material of which it is composed—and what I have in mind is not to be obtained by chance pot-shots at casual subjects seen broadside-on on a river bank. If this example were taken solely with the idea of perfecting the technical side, I should be happy to give it every encouragement, for technique plays a part in the make-up of every picture and nothing can be done with the best of conceptions if the technique is inadequate.

But if that were the idea, the print would not have been entered in competition. It would be kept with other data of a similar kind, and if it were allowed to be published it would only be with the idea of establishing a technical point or something of a similar nature.

To be quite frank, however, I do not think that the fact that prints are judged from the pictorial standpoint has entered into calculation, or, alternatively, it scarcely seems to be appreciated that the print is unable to qualify in this direction.

The Pictorial Idea.

Attention has already been drawn to the fact that the topographical element is uppermost and that the uncompromising broadside-on view of the cottage is a drawback, but, under other conditions, it is possible that something might be done with the material.

The first thing is to make sure of the motive. With a building of this type, an effect of sunshine could be made very attractive. Sunshine does exist in the present rendering, it is true, but it can scarcely rank as an effect because its influence is too widespread and there is not a sufficiency of shadow tone to set it off.

Except for bits here and there, the whole of the scene is in full sunshine, and, before it can achieve any value, a greater proportion of shadow tone must be introduced.

With the light falling as it is, the only way of getting the desired proportion is by altering the line of sight. A viewpoint some little distance to the left, the line of sight being directed more to the right, would bring the shadow side of the buildings into greater prominence, and lessen the visible area in light. The shadow sides of the trees would be accentuated, the sunlight patches would be restricted and the darks increased.

Sunlight and Shadow.

Such a rearrangement of tone would make the sunshine tell much more effectively. The shadows would stress the sunlight. It would then rank as an effect, and, being something not inherent in the subject material, would outweigh its topographical interest and endow it with pictorial appeal.

And if, by any chance, some form of imitation could be introduced, it would enhance that appeal enormously and make a better picture still. With a foreground of water, it is possible that when the surface is unruffled, as it would be on a windless day, the subject would be repeated in the reflections. Such a state of affairs would enable the desired end to be achieved, but, necessarily, it would mean watching and studying the subject until the conditions were suitable.

This, however, means the expenditure of time and trouble, to say nothing of the knowledge required to know what the possibilities of the subject are, and although, upon rare occasions, it sometimes does happen that a subject shows itself at its best at first sight, most of them have to be sought and the most favourable aspect estimated and secured at the next opportunity.

It will therefore be appreciated why I say that casual pot-shots are not likely to produce pictures, and, things being what they are, very little that is worth while can be achieved without commensurate effort.

Material and Effect.

So much has had to be said in connection with this piece of work that I am afraid I have not much space to devote to the remainder, but somewhat similar remarks apply to No. 3, "Old Hamburg," by D. J. Chittenden, which betrays little but a topographical interest.

It also needs something in the nature of an effect to make it aesthetically attractive, and, in the cases of Nos. 4 and 5, "The Bastei," by Miss Olive M. Hirst, and "Treasure Chest," by John Harrison, the titles clearly indicate that the idea is simply to provide a record of the subject material. In the latter, however, the play of light and shade does do something to elevate the theme, but, in view of the expressed intention, it must be assumed that this effect has been obtained *malgré lui*.

There is something of an effect of sunshine and the sky is good in No. 8, "Flats," by B. K. Till, but the perspective is ridiculous and quite spoils any artistic feeling the print might otherwise exhibit. Moreover, the absence of a proper base to the building utterly destroys the sense of stability it should convey, and both this and the distorted perspective are due to the camera being tilted.

The Still-Life Season.

With the winter fast approaching, the opportunity for out-of-door work is restricted and the time for still-life efforts is at hand, for, seeing that the material can be treated under artificial light or daylight indoors, it provides the means whereby our hobby can be continued and our hand kept in till we are able to get out again.

Nos. 2, 6 and 7, "Getting Down to Brass Tacks," by H. L. Waite, "My Table Lamp," by C. Haigh, and "Still Life," by A. G. Chappelow, are examples of this class of work, and, of the three, I am inclined to prefer No. 7, although it does suffer from an undue restriction of the subject material. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

A PHOTOGRAPHIC DAY.

THE other day I motored into Kent with a friend who was once a fellow-member of my first photographic society. He had taken to evil ways; giving up photography and playing tennis, badminton and other violent diversions. Now that he is getting Anno Domini in joints and bellows he has returned to his old love, and is buying new cameras and things.

My particular job was to get a dozen photographs of a factory and its surroundings; and as this by no means filled the day I enjoyed myself. It was hazy at first, but I made a few exposures in case the weather got worse. Later on it brightened, and I got several variations of the subject in Fig. 1.

The older part was once a paper-mill, and there are the remains of the water-wheel; so I took care to show various aspects of the mill-pond, and the sluice gate. One version of the latter is Fig. 4, while Fig. 3 shows the

Fig. 2.

far end of the pool, with one of the cottages seen again in Fig. 2. I am afraid that some of my shots rather exceeded my commission, as they included a church well out of bounds,

and some farmyard stuff still more so.

Now my friend expressed surprise that I was not using an electric meter, and when I said that the reason was that I had not got one, he almost fell into the river. But we had a chat about meters, which is much easier than using them. Amongst other things I pointed out the difficulty of a subject like Fig. 4. Parts of it were dreadfully dark, but the distance was bright; while an important and really decisive factor was the rushing water. This, and not the general lighting, decided the exposure, and the only thing to be done for the dark masses was to use the largest stop that would give reasonably good definition. The whole thing was a compromise, not to be decided arbitrarily by a meter reading.

The same thing applied to Fig. 3, where consideration had to be given to the dark cottages against the light. I said that in my opinion a test of the light was very helpful, but that I had never seen a meter that did not want backing up with a little brain-work, and often a lot of it.

He seemed a bit dubious, but at any rate approved of my use of a filter for such subjects as Figs. 1 and 2.

Fig. 1.

Fig. 3.

After making one of the exposures I was talking to him instead of minding my business, and afterwards felt

Fig. 4.

sure that I had not changed the film in my pack. On developing I found that I had done so, but so absently and carelessly that the film was fogged and ruined. The paper tab must be pulled quite straight

through the slit. Any diversion may cause fog which is often wrongly imputed to a faulty light-trap. On the whole I did not set my friend a good photographic example. And he seemed to know it. W. L. F. W.

The Amateur Photographer and Cinematographer

Annual Lantern-Slide Competition, 1937

Readers are reminded that the latest date for receiving entries is Monday, November 1st, 1937

Classes and Subjects.

- CLASS I.—Landscape, with or without figures, sea subjects and river scenery.
CLASS II.—Portraiture and figure studies, whether indoor or outdoor pictures.
CLASS III.—Architecture, interior and exterior.
CLASS IV.—Flowers, fruit and other "Still-Life" subjects.

- CLASS V.—Natural History subjects.
CLASS VI.—Lantern slides in colour (not hand-coloured).
CLASS VII.—Champion Class. Open only to those who have won silver or bronze plaques in *The Amateur Photographer and Cinematographer* Lantern-Slide Competition.

Conditions and Awards.

(1) All classes are open to amateur and professional photographers without any restriction. All slides must measure $3\frac{1}{2} \times 3\frac{1}{2}$ in., and must be properly spotted for showing in the lantern.

(2) One silver plaque, one bronze plaque, and four certificates are offered in each class except Class VII. In that, the Champion Class, the award will be a mounted and signed exhibition picture by Mr. F. J. Mortimer, the Editor of *The Amateur Photographer and Cinematographer* and *Photograms of the Year*.

(3) All slides which receive any award will become the property of *The Amateur Photographer and Cinematographer*, and will be sent round amongst the societies and such other associations as apply for the loan of them. Any other slides may be selected for circulation in this manner, and will be paid for at the rate of half a crown each.

(4) Competitors may send any number of slides in any class, and may be recorded as winning any number of awards; but no competitor will actually receive in the competition more than one silver plaque, one bronze plaque, and one certificate, on which all his awards will be recorded. Competitors may enter in any number of classes.

(5) Each slide must bear the competitor's name, its title and its class. With the slides must be sent an envelope containing the name and full address of the

competitor, a list of the titles of all the slides he is sending in, and the class in which such are entered. Particulars as to make of plate, exposure, developer used, etc., and other technical data which may be of interest for incorporation in the notes which will accompany the winning slides on their tour among the photographic societies, should also be given where thought necessary.

(6) A stamped and addressed label (not loose stamps) should be sent with the slides for their return if unsuccessful; but in no circumstances can the Editor or the Publisher accept any responsibility for slides sent in for competition, nor for their return; neither can slides be returned which are not accompanied by stamps as above.

(7) Not more than one slide from any one negative can be admitted, nor may any slide compete which has before won an award in these competitions.

(8) The last day for receiving is Monday, November 1st. The slides must be well packed and addressed, "Slide Competition, The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and all carriage charges must be prepaid.

(9) In any case of dispute, the competitor agrees to accept the decision of the Editor of *The Amateur Photographer and Cinematographer* as final.

MAKING BETTER SNAPSHOTS-19

By DAVID CHARLES.

This article is the nineteenth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. Taken into the sun with no lens hood. The patch of light in the foreground is the result of direct sunlight on the lens.

Fig. 2. The sky is not dark enough to suggest night, though it does perhaps suggest evening. The result of over-development.

Fig. 3. Soft development allows the print to be well graded, even though darker than normal.

PHOTOGRAPHY is now an all-season hobby. Yet about this time of year many owners of cameras with not-so-rapid lenses are apt to put them aside, simply because the light begins to give fewer opportunities for making fully-exposed instantaneous exposures "in the hand."

Therefore this is just an appropriate time for showing that under-exposure is by no means always an undesirable thing! For some types of subject considerably less exposure than is considered proper results in attractive and unusual pictures. This week I propose to describe one of these kinds, often called "moonlight effects," in spite of the fact that they are invariably made by photographing the shine produced on water by the sun.

The admiration and praise usually awarded to this kind of picture is very much greater than the not very considerable amount of skill required to make it really deserves. Yet there are several points that want watching. The light is rather yellowish in tinge when the sun is low enough in the heavens to give the best effects, and considerable under-exposure (as compared with other subjects under similar conditions of light) is permissible, or even desirable.

These pseudo-moonlight pictures mainly consist of water and sky; practically all else may be "clear glass" or nearly so in the negative. That is to say, in the print it may be black or a very dark shade indeed of grey. Therefore the exposure need only be about a quarter of the exposures in "The A.P." exposure table.

Extreme care should always be taken not to allow direct

sunlight to fall directly upon the lens. Even if the sun's image is not actually included in the part of its view which falls upon the film and forms the picture, it can still do a great deal of harm. Fig. 1 has been made just to show what does happen when the sun "catches" the lens. First of all there is a large light patch of peculiar shape on the grass in the foreground, and next a less obvious glare all over it. The

shape, the size, and the position of this patch depends upon the particular lens, but very few lenses do not produce it. Therefore a lens-hood is practically essential, to shade off the actual sun while including some of the sky immediately below it. Sometimes it happens that the sun gives the desired shine on the water while being itself screened by a tree, but such good fortune cannot be depended upon. Results are usually best when the sun is just obscured by the edge of a cloud.

The next most important point to watch is that the negative be not over-developed. It is important to remember that most of the high-light detail ought to print through without losing the fainter near-blacks. Otherwise the result quite loses all sense of perspective or distance. It is also very desirable for obtaining the true "night" effect to print the sky portion a little stronger than the rest. This is because in any case the sky of any daylight exposure prints light; but the sky at night is dark! Over-development of a negative makes the sky so dense that the extra printing-up to look like night produces an obviously false result.

Fig. 4. If a boat can be caught passing through the path of the "moon" on the water, some striking effects are obtainable.

A Nude Study

By JOHN P. MUNN.

IT was a special meeting of the club. A temporary member of six months' standing wished to offer thanks to the members for services rendered prior to departing from the town. He engaged a large room in a hotel, where tea was to be provided. Probably the latter was not unconnected with the full attendance of members. In any case, they came up to the scratch on this occasion and brought along prints as requested, for criticism by the president and the local high school art master.

Included amongst these was the nude study, "The Sun Bather," and prior to the commencement of the meeting it was greatly admired, and many comments made. There was a general curiosity regarding the model, which was, however, left unquenched meantime.

In due course this print was criticised. "Too little of this type of work was done," said the art master. "The human body was a beautiful

The Sun Bather.

object and deserved to be depicted oftener. Look at the beautiful lines. It was a mistake of course to include a parasol at all. The entire figure should have been shown. Nevertheless, it was a work of art. See how the texture of the skin was rendered? A truly delightful picture," etc., etc.

The president's remarks followed on similar lines and all the members

agreed when the picture was passed round. More clamour then arose concerning the model, and at the request of the president, who was aware of her identity, the photographer produced his model, of whom a portrait appears on page 437. Great was the consternation amongst the mighty. Then followed the applause while the photographer literally preened himself on his cleverness.

A Photo-Electric Meter for Enlarging

THE "Majus" Enlarging Meter is a highly sensitive photo-electric instrument intended for determining the exposure required in making enlargements. It consists of a large photo cell, a two-range indicating meter, and a movable scale. For easy reading in the dark the scale is illuminated by a small electric bulb worked from a battery contained within the meter.

The movable scale has to be set to suit the speed of the bromide paper being used. This is done by setting up the enlarger and making a series of test-strips to determine the correct exposure. The meter is then held close up against the lens of the enlarger and a figure for the speed of the paper is read off from the scale.

The "Majus" Enlarging Meter.

So long as this same paper is used, the "Majus" enables its user to dispense with test-strips, whatever may be the size of the enlargement the density of the negative, or the aperture to which the lens of the enlarger is adjusted. It is only necessary to set the speed-number of the paper against the size to which the image of the negative is projected and to hold the meter close up to the lens of the enlarger. The pointer of the "Majus" then moves over the scale and indicates directly, in minutes or seconds, the exposure required.

The meter, which is priced at £14 10s., can be obtained through any dealer, or direct from Messrs. J. H. Dallmeyer Ltd., at 31, Mortimer Street, W.1.

A STAFFORDSHIRE TOBY JUG.

MANY an enthusiastic lover of antiques is not sufficiently well off to accumulate the collection that he would so dearly love to own, for antiques of all kinds are expensive. And even if the financial obstacle were removed by the wand of some fairy god-mother, there would still remain another—the obstinate fact that many prized pieces are in the hands of other collectors who have no wish to sell.

It is therefore a good plan to augment the collection, large or small, of real antiques with a second collection consisting of photographs of pieces which, for either the financial reason or another, cannot be acquired in reality. By so doing it is possible to become a kind of part-owner of all the finest examples that your friends possess, and even, by suitable fees in cash or prints, of many objects offered for sale by dealers.

A friend of mine has fifty half-plate photographs of old Chelsea ware, but being a poor man he only possesses one very ordinary specimen of his own. Yet a collection of photographs such as this not only forms a basis of comparison on which to judge other articles of the same kind, but in addition it gives an opportunity for studying many small points and so helps immensely to supplement the collector's fund of knowledge.

The actual photography of old pieces is by no means easy, and if they do happen to be in someone else's house, then the anxious owner is often inclined to be rather difficult. I suppose it is natural that he should wear an anxious expression until the particular piece is safely back in its proper position in the cabinet, but all this is anything but helpful to the inexperienced photographer, and may give him an attack of nerves. Quite

Collecting Antiques

By
HADYN
WOOD.

Collecting antiques tends to be an expensive hobby. In this article it is suggested that the enthusiastic lover of the old and quaint or of the old and beautiful should, more economically, collect photographs where he cannot afford to acquire the originals.

apart from the tense mental condition of the camera-man when he is working away from home, he often has to contend with poor lighting conditions and cramped surroundings. Indeed, there is no lack of variety in the difficulties he has to overcome, but to my mind these help to make the work fascinating and full of interest.

To do full justice to the photography of antiques it is essential to have a good camera; that is, one equipped with all the necessary movements, double extension and a focussing screen. A well-hooded screen is greatly desirable, and to increase its efficiency it is a good plan

AN ANTIQUE CLARET FLAGON.

to rub a little vaseline into the glass, which helps to make the image clear and facilitates fine and accurate focussing. In this branch of photography the aim of the worker is to obtain sparkling prints full of rich detail, and truthful records of shape, decoration and tones of colour in monochrome.

I find that backed S.G. pan. plates are the most useful, especially for pottery, glass and coloured articles, and in conjunction with Beta (deep orange three times filter) and Gamma (light green six times filter) these give excellent results. For very dull but evenly illuminated interiors I have found process plates very useful, and though a long exposure is necessary, this is not always a serious disadvantage. Panchromatic process plates show off the rich figuring of certain woods, and in those cases where it is required to stress the differences

TWO OLD BRASS TRIVETS.

in colour or grain they can be of great value. When using these very slow plates it is of the utmost importance that the tripod should be firm and not easily shaken by ordinary vibrations. I have wasted many a good plate by using a metal tripod with shaky legs.

The question of lighting offers the

most serious difficulties. Generally, flashlight is ruled out owing to the risk of fire, and electric light is very often not available, so that the photographer has to manage as best he can, unless, of course, he can afford to use Sashalite bulbs. A great deal can be done by the use of white sheets to act as reflectors, and the manipulation of curtains or window blinds.

It is well to remember that dull but even lighting will give better results than uneven lighting, and many inexperienced workers are tempted to take photographs of pieces of furniture half in the bright light

from a window, and half in deep shadow. The excessive contrast this produces can always be relied upon to spoil the rendering of surface texture. An exposure meter is a necessity, and although I have tried several different kinds, I like the old Watkins Bee Meter best of all for this specialised work.

Half a dozen Hints on Fixing

IN its way, fixing is quite as important as exposure or development, but usually the beginner is not nearly careful enough in this matter. When the film or print leaves the developing dish, it bears on its surface both the image that we want to retain and the unaffected haloid salts of silver that we do not want, and therefore must remove. The business of the fixing bath is therefore a dissolving action. That is to say, the parts of the emulsion unaffected by the developer are first dissolved by the hypo solution, and then, in the washing process, this dissolved silver is washed out of the film just in the way that after washing a garment in soap and water we require to remove the mixture of dirt and soap by rinsing in plain water.

1.—Now no amount of rinsing in plain water will get oil out of a greasy rag, and so no amount of washing will get rid of the undeveloped silver haloid unless it has first been put into a soluble form. Hence the need of a fixing bath that is capable of doing its duty, if time enough is allowed for it to act. Note, then, these two things, viz., the fixing bath must be in a proper working order, and time enough allowed for it to do its work. These are the two foundation facts of this operation.

2.—The beginner very naturally makes the mistake of thinking that the stronger the bath in hypo the better; but this is not the case at all. It has been shown that a very strong bath does not act as effectively as one of lower strength. The practical limits advised for all but special purposes are from 3 to 6 oz. of hypo to each pint of water, the former strength being mostly used for papers and the latter for films and plates.

3.—A plain hypo bath soon gets alkaline on account of the developer carried over with each film or print put into it. This means that the developer still in the emulsion or paper will continue to work until the undeveloped salts are dissolved out, and that in any case it will take up oxygen from the air. Oxidised developer is highly coloured, so that if this process is allowed to go on, prints, and possibly films too, will almost infallibly be stained. The action of the developer is therefore checked, and its oxidation prevented, by making the bath acid. This is done by adding potassium metabisulphite, or some more or less equivalent mixture, to the plain solution of hypo.

4.—To make up a standard fixing bath suitable for plates, films, and prints on any but daylight printing paper, put 4 oz.

($\frac{1}{2}$ lb.) of hypo into a pint jug and fill it up with warm water. The crystals will soon dissolve, cooling the water down in the process. When they are nearly gone, add about $\frac{1}{2}$ oz. of potassium metabisulphite.

None of these quantities need be exactly measured; a guessed quarter of a pound packet of hypo, water to fill a jug reputed to hold a pint, together with a generous couple of teaspoonfuls of metabisulphite, will make as good a fixing bath as the exact amounts stated.

5.—Acid fixing baths do not indicate their age by discolouring with use, as the old-fashioned plain hypo did. If fixing films, throw the hypo away as soon as it takes noticeably longer to clear the film than it did when new, and don't overlook the fact that a film is probably not properly fixed until it has been in the hypo for a total time at least double that which it takes to clear. Prints clear almost instantaneously, as can be seen by the blackening of the shadows, but they require a little extra time, too.

6.—In fixing negatives a hypo bath is not likely to be seriously over-worked, because negatives, except perhaps just after the holidays, are seldom developed in large batches. Prints, especially at this time of year when holiday negatives are being printed, are more often made in quantity. If the hypo bath is well loaded up with silver from having done a good deal of work, it may be incapable of removing from a print the last trace of unused silver salt. That print will inevitably fade or stain, sooner or later.

It is therefore a good plan to use two hypo baths when printing, giving each print a minute or two in the first to remove the bulk of the silver, and then transferring it to the second to be freed of the last traces. Used thus, in two half-pints, a jugful of hypo will fix, and fix properly, five or six times as many prints as if it were used all in one dish.

When the first bath begins to get old, promote the second to that position and take some fresh hypo for the new second bath. And remember that the first bath gets all the developer carried over; make sure it contains plenty of metabisulphite to prevent that developer from staining the prints. Too much can do no harm; too little may result in a batch of prints only found to be stained and useless when seen next morning by daylight.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Secondary Motion By D. CHARLES OTTLEY.

MOST ciné camera users have little time to spare during the first months of their hobby to consider the significance of *motion* and its relationship to every foot of film exposed. A time comes, however, when a deeper understanding of cinematic technique is desired and for these this article is written.

There are two distinct and separate kinds of motion which characterise any scene projected upon the screen, as apart from what is known as *animation* in the pure cinematic sense. The first of these is primary motion and constitutes the action of players as controlled by the director or individual responsible for the production. The second, which is known as secondary motion, incorporates all movement not controlled by the players or director.

The Living "Still."

Compare a slide projected by a lantern with a length of film of the same scene shot from the same viewpoint. The difference is only one of motion (primary, or secondary, or both), but how pronounced that difference is. Primary motion, comprehensive though it may be, is a simple thing when viewed alongside the uncontrolled, infinitely more subtle movements of sea or sky or expanse of grass-covered meadow. Nature's movements are bewildering in their uncertainty, but if we cut them out, or *could* cut them out (as indeed we do when projecting so-called "stills") what a stark, unnaturalness attaches to the scene. One might differentiate between an ordinary snapshot and a photograph of high artistic merit by saying that one is merely a shot of motion without motion and the other a picture of motion carefully composed to suggest motion with every artifice of light and shade and careful balance called into operation to do so. Indeed, the basis of all photographic development, prior to the ciné camera, was one of compensation.

Incidental Movement.

Studio sets stand or fall by the preservation or otherwise of secondary motion. The sway of a curtain, the smoke from a cigarette, the shadow from a leaf-laden tree seen through an open window, the flutter of my lady's flimsy dress—all such are examples of secondary motion.

The ciné amateur, like his professional brother, can control the movements of his players. A lady can walk along a bank beside a still, calm stream and while walking can do his bidding. The reflection of the lady, as mirrored in the water, is not his to command. The

slightest breeze may shatter the image into a thousand quivering ripples, each ripple forming a little cameo of motion on its own. This is Nature's intervention, secondary motion, but as essential as the controlled primary motion of the player.

Where Observation Helps.

If the camera-man, whether amateur or professional, is *conscious* of this secondary influence he can make good use of such consciousness, while he who aims at studio reconstruction of outdoor sets *must* of necessity know as much as possible about it. He cannot watch the ways of Nature too closely, nor should he lose any opportunity of associating the movement of *things* with the movements of *persons*.

The subject is infinite and offers a pleasant relaxation from actual film-making. A favourite lesson and one that is full of fruitful material is a garden. Take, for example, the Dutch garden at Kensington Palace. One can spend a whole afternoon peering through the loop-holed hedge watching the drama of Nature as enacted by her players. The colour content of bed upon bed of flowers, the red massed alongside the

blue against a semi-background of green and a final background of azure sky. Notice particularly the butterflies, probably the most difficult artist known to cinematographers. Compared with these the queen bee is easy to handle. Round the fountain tanks battles wage between feathered creatures big and little. At least a dozen skirmishes in half an hour, each one a subject worthy of the screen if only you are quick enough.

Restless Wild Life.

And against the fighting birds the bathing sparrows. Ablutions diligently carried out despite many interruptions by the pigeons. Breezes blow and the blue and red beds sway in rhythmic majesty this way and that. The azure sky gradually changes to yellow. Over the hedges swarms of birds swoop to their night quarters—the air becomes vibrant with an agitated crescendo of song. Mauve, red; low-lying clouds and a setting sun. Animation, harmony, melody. Nature's living picture of herself, her ways and her children. Secondary motion . . . true cinema; a subject for anyone possessed of eyes, ears and an understanding. . . with or without a ciné camera.

Almost any trade, occupation, or craft can form the subject of a documentary film of great interest. Thatching is nowadays rather a rare art, and would in consequence make a film that might quite soon be of real historical value. Other suggestions of similar type can be gleaned from the article on page 413 of this issue.

Editing Amateur Films

THE importance of editing can best be appreciated by comparing the films of Pudovkin and Eisenstein with the average American production, or the documentaries of Grierson and Rotha with the so-called "shorts" of Yankee origin.

Consummate editing and the remarkable use of a three-word sub-title made "Storm Over Asia" one of the world's greatest films, while a superbly written and spoken commentary, plus admirable cutting, places "Song of Ceylon" at the top of the documentary achievements of the screen.

Keep Embellishments Few.

The amateur should be wary in the use of the "mix," the "fade" and the "pan." Likewise the matter of sub-titles needs careful attention; and more attention still must be given to the musical accompaniment.

It is difficult to lay down hard and fast rules regarding these so-called "artistic embellishments," the chief thing to avoid being their indiscriminate use just to show how clever we are. Similarly, staining, toning, or the incorporation of colour sequences should

be given careful consideration, the vital question being, do they promote the particular argument we desire to present via cinema?

How Editing is Done.

Let us consider an elementary subject like marching troops. Nothing very thrilling attaches nowadays to a battalion of soldiers passing the camera in column of fours. Such a shot was taken by the author at Hampton Court when the Indian contingent arrived for the Coronation. Having expended 30 ft. of 9.5-mm. on the procession, another 15 ft. saw the rear of the column pass down the drive towards the camp. During the filming the obvious accompaniment seemed to be "Marche Indienne," and at the editing bench the passing files were three times intercut with twenty-frame shots of female statuary. The psychological inference is that man attracts woman. Conversely, were females parading any inter-cut shots would be of males. To use the fade or mix here would be aesthetically wrong. Only a momentary suggestion of sex curiosity is desired. To ponder the relationship would be to slow down

tempo and lose the rhythmic significance of marching troops. The closing-in of a large crowd upon the retreating files suggest a postponement of the fade-out until a slow upward traverse of the camera brings into view a single Union Jack swaying gaily in the breeze. With this as centre of interest, and a cloud-swept sky as background, a slow closing of the iris seems a natural finale to the incident.

Another Example.

Another "interlude" in the same film was based on Saint Saens' "Dying Swan" music. Swans are good subjects for filming only when coaxed to do your bidding. The swan under discussion was persuaded to leave the water and rest upon the steps of an ancient pedestal. Here she carried out a series of neck and wing exercises and ultimately returned to the water... and her mate. To intercut here would be bad technique. The tempo, alike of music and picture, is definitely *andante*. The final gliding away of the swan upon gold-crested ripples (lens well hooded) provides a picture that only the fade-out can bring to a logical termination. D.C.O.

The Week's Meetings

Wednesday, October 13th.

Birmingham P.S. Films. A. G. Greaves.
Brighton and Hove C.C. "Charcoal Black and Etchadine."
Croydon C.C. "The Treatment of Negatives." H. Alfred Hayes.
Edinburgh P.S. Meeting of Portfolio Contributors and others interested.
Hinckley and D.P.S. Demonstration on Lantern-Slide Making. H. W. Brookes.
Leominster P.S. Beginners' Night.
Luton and D.C.C. Annual General Meeting at 8 p.m.
Mountain Ash C.C. One-Man Show. E. H. Griffiths.
Northallerton and D.P. and C.S. "Birds and Flowers of the Pickering District."
North-West London C.C. Meeting at 110, Haverstock Hill, Hampstead, N.W.3.
Pontracraft P.S. "Gaslight Printing." J. H. Lenton.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

THE 35-mm. POSTAL PORTFOLIO.

SIR,—There are at present in existence three organisations of postal clubs which have a particular appeal to miniature workers, the Photographic Miniature Postal Portfolios (P.M.P.P.), founded for production of miniature prints, the Photographic Postal Portfolios (P.P.P.), catering for workers interested in prints up to 15×12 in. in size, and the Leica Postal Portfolios (L.P.P.), open to users of Leica cameras only.

There is, however, no photographic postal club catering exclusively for the numerous other 35-mm. cameras now on the market, all of whose owners are faced with problems similar to those of the Leica users; and it is to further the work and aims of this keen body of workers that the present club has been formed. The new organisation will be known as the 35-mm. Postal Portfolios (35 P.P.), and will seek affiliation to the Association of Postal Portfolios as have the aforementioned organisations. The 35 P.P. will follow the lines of the L.P.P.; portfolios will be circulated monthly, and for the present it is not intended that prints should exceed twelve square inches in size. There will be the usual lecturettes, articles and notebook discussions.

Users of all types of cameras taking 35-mm. films are eligible to join, and the secretary will be pleased to hear from all workers who do their own processing, who are interested in the new club.—Yours, etc.,

A. T. GRUBB
(Hon. Secretary).

41, Grasmere Avenue, Acton, W.3.

PERFORMANCE OF CHEAP CAMERAS.

SIR,—The correspondence on this subject indicates that it is of considerable general interest. To reply briefly to one or two points raised. Mr. Long says that the hundredth of an inch tolerance is allowable both in front of and behind the true focus. This is quite true, but my main concern was to show the smallness of the allowable margin of error. Mr. Telfer finds no trouble in practice with his Baby Ikonta. Probably it is to be expected that the smaller the picture size the less the possible cockling of backing paper and the flatter the film.

Since writing my letter I notice that the idea of using roll film without backing paper has already been adopted by the Compass Camera Co., who evidently find the presence of backing-paper inimical to fine definition, despite the tiny size of the picture.

I have recently examined some of the highest-grade twin-lens reflex cameras, now so popular. The precision of the mechanism for moving the lens front with true parallelism is admirable, as is everything else about the job, until one looks at the flimsy bent sheet-metal strips over which the film passes, and which have only to get "out" by the thickness of a postage stamp to lose the advantages of a large-aperture lens. From a careful test made for me by a brother engineer it is evident that the twin-lens reflex will not permit of sharp five-times enlargements at full aperture of f/3.5!

But the most significant letters on this subject, sir, are those which you have not received from the camera-makers, who would have blown out my simple arithmetic and equally simple deductions if they could. Do they think it policy to ignore the matter? No, I prefer to think that their designers are already busy building the same quality into the film end as they have already done into the lens end, seeing to it that the relations between the range-finder and the distance scale are those of true marriage and not an occasional flirtation, producing for the first time a camera larger than ciné size which will really give needle-sharp definition at full aperture.—Yours, etc.,

R. E. DICKINSON.

FILM PACKS IN A GOERZ TENAX.

SIR,—Under the heading "Miniature Matters," in a recent number of *The Amateur Photographer*, I see that a reader who signs himself G. H. B. (Essex) is in trouble with a Goerz V.P. Tenax, using a pack adapter, and cannot get sharp pictures.

Is he, by any chance, using it without the supplementary lens which screws into the front cell and is absolutely essential to correct the focus when using a pack adapter? It sounds very much like it to me.—Yours, etc.,

(REV.) JOHN CONOLLY.

A LETTER FROM CANADA.

SIR,—As a new member in your circle of readers, having started just a little over a year ago, I thought I would like to tell you of the real pleasure with which I look forward each week to my copy of "The A.P." I enjoy every page, even the adverts.—it is so different from anything we get here in Canada, or the U.S.A. It really lives up to its name.

I am the owner of a Rolleicord camera, and certainly enjoy any articles you print on "the twin-lens reflex." I would be glad to hear from any readers who use these cameras—Rolleicord—who have any new ideas in their use.

Thanking you for the help you have been in the past, and wishing you every success for the future.—Yours, etc.,

E. A. COLLIS.
(Ontario.)

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, October 30. Rules in the issue of September 29.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

XVIe Salon International de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

XXXIIe Salon International d'Art Photographique de Paris.—Open, October 2–17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of the Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Woolwich P.S.—Twenty-first Exhibition. October 11–16, Old Town Hall, William Street, Woolwich. Open daily, 1.30 to 9.30 p.m. Admission free. (R. E. Perry, 51, Kinveachy Gardens, Charlton, S.E.7.)

The Victorian International Salon.—Open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Open, October. (Modern Magyar Fényképezők, VIII, Rákóczi-ut, 19, Budapest, Hungary.)

Windsorham Camera Club.—Open, October 21–23. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Folkestone C.C. Exhibition of Photography.—Entries, October 16; open, October 23–December 4. (A. J. Stewart, 25, Guildhall Street, Folkestone.)

Fourth Canadian International Salon of Photo-

graphic Art.—Open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Rotherham Photographic Society, Forty-eighth Annual International Exhibition.—Open, October 12–16 inclusive. (E. G. Alderman, Ruardean, Newton Street, Rotherham, Yorks.)

Sixth Irish Salon of Photography.—Open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

Cyclists' Touring Club (Metropolitan D.A.) Second Annual Photographic Competition.—Open, October 28–30. (G. H. Craddock, 9, Lady Margaret Road, Kentish Town, N.W.5.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

G.E.C. (Coventry) P.S. 4th Annual Exhibition.—Entries, October 14; open, November 8–13. (C. W. Crowe, G.E.C. (Coventry) Photographic Society, General Electric Co. Ltd., Coventry.)

Bournemouth C.C. Open Exhibition of Pictorial Photography.—Entries, October 18; open, October 25–30. (John Reid, Westminster Hall, Beacon Road, Bournemouth.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 105, Westminster Street Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

XIe International Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Brederodestr, 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31, 1938; open, March 7–12, 1938. (D. H. Cole, 11, Woodlands Road, Ilford, Essex.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April, 1938. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

The opening of the winter season has brought in a flood of "fixture cards" from photographic societies in all parts of the country. Secretaries wishing to have their meetings announced in our "Week's Meetings" columns should let us have a note of their fixtures as soon as possible.

The Kinofilm tank is designed for developing the ordinary 36-exposure length of 35-mm. ciné film as used in miniature cameras of most makes. The tank is loaded in darkness by inserting the end of the film, suitably trimmed to give easy-running rounded corners, into the spool, and pushing it in until the spool has taken up the whole of the film. This is held by its edges in the spiral grooves moulded in the inside faces of the spool-flanges, successive turns being kept well apart in this way without the need for an apron. The tank, which requires 450 c.c. (15½ oz.) of developer, can be used in daylight, the inlet and outlet for the solutions being adequately light-trapped. A stirrer is provided for rotating the spool without opening the tank. The film can be fixed and washed in running water without removing it from the tank, and after use the spool is taken apart for the thorough drying that is so necessary with any tank of this type. The Kinofilm tank is obtainable through any dealer, and is imported by George H. Potts, Ltd., of 7 and 9, Baker Street, W.1.

The thirteenth edition, entirely rewritten and illustrated with 280 drawings and photographs, of *The Autocar Handbook* is now available. It is completely up-to-date and has a section devoted to independent suspension, and the various transmissions now popular are fully explained and illustrated. New to the handbook are special chapters on Coachwork, Care and Maintenance of the Car, and Law and the Motorist. *The Autocar Handbook* is published by Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1, at 2s. 6d. net.

The Woolwich Photographic Society is now holding its 21st Exhibition in the Old Town Hall, William Street, Woolwich, from 1.30 to 9.30 p.m. daily. Admission is free to the Exhibition, and for the evenings an interesting programme of lantern lectures has been arranged, one of which will be of particular interest to photographers in the district, the title being "The Borough of Woolwich," by members of the Society. This will be at 8 p.m. on Saturday, October 16th, on which night also the prizes will be awarded for the Snapshot Competition. All information regarding the Society may be obtained from Mr. R. J. Dobinson, Brockhurst, 27, Mereworth Drive, Shooters Hill, S.E.18.

The winter season has just opened for the Erdington and District Photographic Society. The Hon. Secretary, Mr. H. C. Chamberlin, 36, Grange Road, Erdington, Birmingham, will be pleased to supply further information to any amateur photographers in the district who are interested.

Arrangements have now been made for tourists to take unprocessed sub-standard cinematographic films out of Italy. Travellers should take the precaution of obtaining, before departure, a letter from the London Office of the Italian State Tourist Department (38, Piccadilly, London, W.1), which will authorise them to take the undeveloped films out of Italy. Except in a few zones of military importance, there are no restrictions whatever in the use of ordinary or sub-standard cinematographic cameras.

Eight 4×4 cm. Rolleiflex cameras fitted with f/2.8 Tessars; two Rolleicord Model II cameras, with f/3.5 Triotars, and one Tempophot meter were recently stolen from the premises of Messrs. R. F. Hunter, Ltd., 51, Gray's Inn Road, W.C.1. The Rolleiflex cameras are numbered 522289, 522347, 522348, 522356, 522358, 522359, 522370 and 522373. The Triotar lenses on the Rolleicord cameras are numbered 1972491 and 1972806, and the Tempo-

phot meter is a Leica model bearing the number 622078. If any reader should be offered any of these instruments, or should find himself in a position to give any information of any kind as to their whereabouts, he should communicate immediately with Messrs. R. F. Hunter at the above address (telephone, Holborn 7311), and with the police either at Gray's Inn Road Police Station or, if it entails less delay, at his local police station.

The Miscellaneous Trading Co. Ltd. ask us to announce that they have moved to more commodious premises at 134-135, High Holborn, W.C.1, to which address all future communications should be sent.

Surrey readers should note that the Windlesham Camera Club (Hon. Sec., Mr. J. C. Hayward, Hallgrove, Bagshot) is considering the formation of a branch at Weybridge, and will do so if the number of members living within reach of Weybridge increases enough to make it worth while. New members, therefore, are invited to join. Any reader who may be in or near Bagshot on October 21st, 22nd or 23rd, will be cordially welcomed at the Club's Annual Exhibition at St. Anne's Hall.

The first winner in the new Wallace Heaton "Novelty Competition" is Mr. Clarence Ponting, The Little House, Pangbourne, Berks, to whom the weekly award of one guinea has been made. The title of the winning print is "Pattern in Pots." Readers will find full particulars regarding these competitions in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulae and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulae issued by the leading manufacturers of plates, films and papers.

These facts and formulae are intended to be cut out and pasted on the thin cards of the standard size, 5×3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½×3½×3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

96. Makers' Formulæ: Developers for Ilford Papers—(2)

ID-21. M.Q. for Press Bromide Paper.

Metal	..	15 grs. (1.7 grm.)
Sodium sulphite (anhydrous)	..	220 grs. (25 grm.)
Hydroquinone	..	55 grs. (6.25 grm.)
Sodium carbonate (anhydrous)	..	285 grs. (32.5 grm.)
Potassium bromide	..	55 grs. (6.25 grm.)
Water up to	..	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 770 grs. (87.5 grm.).

This developer is used undiluted, and development takes about one minute.

ID-23. Special Clorona Developer.

Metal	..	2½ grs. (0.25 grm.)
Chlorquinol or Adurol	..	27 grs. (3.1 grm.)
Hydroquinone	..	27 grs. (3.1 grm.)

Sodium sulphite (anhydrous) .. 220 grs. (25 grm.)

Sodium carbonate (anhydrous) .. 165 grs. (18.5 grm.)

Potassium bromide .. 4 grs. (0.45 grm.)

Water to make .. 20 oz. (1,000 c.c.)

If crystallised carbonate and sulphite are used, take 440 grs. (50 grm.) of each.

For normal tones, development should be complete in about 1½ minutes. Mixed with 3 parts of water, it gives a warm-black colour in about 3 minutes. More exposure and dilution with 6 parts of water gives a sepia in about the same time. Colder or warmer tones may be obtained by reducing or increasing the potassium bromide.

This developer, as Ilford Clorona developer, is available in packets and tins.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Converting a Camera.

I have a folding plate camera of good make, and am quite satisfied with it except that I should like to use roll films. Could I have it converted into a roll-film camera? And can you give any idea of the cost of the conversion?

H. A. (Harrogate.)

To have your plate camera converted into a roll-film camera of conventional type would conceivably be possible, but it would certainly cost a very great deal more than buying a factory-made roll-film camera complete. By far your best plan is to carry out the "conversion" by selling your present camera and investing the proceeds in a roll-film instrument.

If your camera is of size $3\frac{1}{2} \times 2\frac{1}{2}$ in. you have an alternative; you can buy a roll-film adapter to take the place of the dark slides. Probably the adapter will have to be specially fitted to ensure perfect register, but this will only be a matter of a few shillings at most. We believe these adapters are only made for $3\frac{1}{2} \times 2\frac{1}{2}$ films, but you could doubtless have one fitted, without much extra expense, to any camera of larger size.

Fast Work.

I wish to purchase a camera for taking snapshots of people walking or running in a reasonably good light. I should prefer one with a fixed-focus lens giving everything sharp at distances over 6 ft., and the size should be $3\frac{1}{2} \times 2\frac{1}{2}$. What do you recommend?

M. V. S. (Birmingham.)

To get everything sharp, to a high standard, at 6 ft. or over on a $3\frac{1}{2} \times 2\frac{1}{2}$ camera with a lens of normal focal length, this will have to be stopped down to f/32 or smaller. At such an aperture the photography of moving objects is quite impossible, as even on a brilliant day the exposure at this time of year would have to be about 1/8th sec. on the fastest film.

Such moving figures as you suggest will require snapshot exposures not longer than 1/100th sec. if they are to be rendered sharply; in some cases exposures will have to be very much shorter even than this. You will therefore need a shutter speeded up to, say, 1/300th sec. and a lens of aperture not less than f/4.5 if you are to get adequately exposed negatives free from blur through movement. With such a lens at full

aperture focussing will of necessity be fairly critical, but this you will have to accept as an inescapable fact.

Green Tones on Bromide Paper.

Can you please give me a reliable formula for getting green tones on bromide paper?

M. H. W. (Edinburgh.)

You really want much more than a formula for telling you how to get green tones on bromide paper; the process is complicated, and the instructions occupy nearly a page of print in the Dictionary of Photography. In our opinion the method is in any case not a very satisfactory one, and if for any reason you want green tones we think you would do very much better to obtain them from bromide prints by the Carbro method, which gives results of predictable colour and undoubted permanence.

Glass for Filters.

I am thinking of buying some gelatine filters and cementing them, with Canada balsam, between pieces of glass. Would the glass from old plates be suitable, or would a filter so made spoil the definition of my lens, an f/4.5 anastigmat?

P. L. F. (Salford.)

Filters must be made with glass of decidedly higher optical quality than that used for photographic plates. If you wish to use the filters for temporary experimental purposes you should leave them unmounted as plain gelatine. If, however, you want to add them permanently to your equipment, you will have to buy them ready cemented into glass of optical quality high enough to ensure that they will not degrade the definition given by your lens.

Amateur Status.

Is a person who sells a photograph debarred thereafter from entering photographic competitions as an amateur? W. R. M. M. (London.)

There is no sharp dividing line between amateur photographers and professionals. A photographer selling prints is not regarded as a professional unless he either makes a livelihood in that way, or at least succeeds in making a substantial and regular addition to his income. Although we know of no ruling as to what constitutes a "substantial addition," it is quite certain that the occasional sale of an odd print here and there does not convert an amateur into a professional.

"Photographic Abstracts."

Can you tell me anything about "Photographic Abstracts?" It is, I believe, published by the Royal Photographic Society. Would it be helpful to an ordinary amateur anxious to improve his technique?

L. M. (Tasmania.)

The publication to which you refer is a highly technical one, and is mainly concerned with indicating the sources of information as to the photographic research work being published in the scientific journals of the world. It would not in the least help the amateur photographer to improve his work; its intention is to provide information for the worker in the research laboratory.

A small china doll, with a slab of sandstone for a cliff, pebbles for rocks, sand, and a home-made parasol formed the picture shown on page 430. The half-crown, with back and front view of doll, gives an idea of relative sizes.

MINIATURE ENLARGERS

In just the same way as we are looked upon both by the public and by the photographic trade as being the leading miniature camera specialists, so have we also that enviable reputation where miniature enlargers are concerned. For this reason, makers bring their goods to us before going elsewhere, and often go no farther because our orders leave them temporarily without stocks. Therefore, for the latest innovations, and the best service, we stand alone.

"Try 202 for Service."

THE NEW MULTIFAX ENLARGERS

This range of enlargers is undoubtedly destined to climb to a very high place in the miniature photographic world. Their specification is matchless, and the work they turn out superb. A few points from their specification, such as the extra tall lamp-house, the ability to be used as projectors, double condenser lighting interchangeable with diffused lighting, three up-rights to secure girder-principle rigidity, an f/4.5 lens with iris diaphragm, liftable negative holder, and orange swing filter, only go to show how low the prices of

£9 5 0 for negatives up to 4×4 cm.
£13 10 0 " " 6×6 cm.
£14 15 0 " " 6.5×6 cm.
really are.

THE NEW AUTO-VERTEX ENLARGER

We illustrate the new Auto-Vertex, which, although only limited stocks are available at the moment, can now be supplied. There are models to take either the Leica or Contax lenses, or for the miniaturist not wishing to use his own lens, there are models with f/4.5 or f/3.5 anastigmats. The negative sizes range from 4×4, through 6×6 to 6.5×9 cm., and the prices from eleven guineas. Why not call for a demonstration; the enlargers are sufficiently good to warrant your going out of your way?

THE FAM

Last week, in our page advertisement, we spoke of the pleasure we have experienced at seeing the truly remarkable performance put up in our developing and printing works by the FAM enlargers installed there. Since then, we have had many customers writing to us to tell us how very pleased they, too, are with their FAM enlargers, and it has just occurred to us that you may not already know what very fine pieces of work these models are. If this should be so, please write now for the booklet "Miniature Enlargers and Accessories," by R. G. Lewis. We feel confident that you will find this of interest. Hire purchase terms are, of course, available.

SECOND-HAND MINIATURE ENLARGERS

Ensign Miniature Magnaprint, to take Leica lens. As new.....£3 19 6
Praxidos, non-automatic model, for negatives up to V.P. size, f/3.5 Primotar.....£6 15 0
Leitz Valoy Enlarger, 40-in. column. As new £8 0 0

Leitz Valoy Enlarger, standard column. As new £7 10 0
Zeiss Automatic Miraphot, for negatives up to 3½×2½, f/4.5 Tessar.....£7 5 0
Duplex Lumimax Enlarger Projector, taking Exakta lens. As new.....£7 10 0

Automatic Praxidos, for negatives up to V.P. size, f/6.3 lens, swing filter.....£4 5 0
Exakta Model IIa, with long pillar, special liftable negative holder, iris diaphragm. Cost about £25 10s. As new.....£17 10 0

(HOLBORN 4780.)

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

Put Autumn

on your

mantelpiece

with . . .

You have longed to take pictures in colour. Now you can do so — with just as much simplicity as you snap in black and white. You can use Dufaycolor film in any camera, and back come transparencies in perfect, natural colour, from which you may have as many black and white prints as you wish.

Go out this week-end and capture the golds and browns and reds of Autumn. Photography will become a new and vivid interest to you—because now you will see your pictures in luminous transparencies as your own eye saw the subjects in natural light.

For the cine enthusiast there is Dufaycolor film in both 16 mm. and 9.5 mm. Colour photography—both still and in movies—is here. Dufaycolor! Full information and films at all Photographic Dealers.

DUFAY-CHROMEX LIMITED 14-16 COCKSPUR STREET LONDON SW1

CARL ZEISS
(LONDON) LTD.

To catch children unaware and thus obtain a delightfully natural picture, it is necessary to have a modern precision camera—one which can be brought into use without a moment's delay—and a high-aperture lens—

A ZEISS TESSAR LENS

Illustrated catalogue P.51 free on request from:—

CARL ZEISS (LONDON) LTD.
Mortimer House, 37-41, Mortimer Street, W.1

NEW! A DISTANCE FINDER WITH DEPTH-OF-FOCUS SCALE

The CENTRAL Range-finder is the only one of its type on the market having a depth-of-focus scale which can be set according to the focal length of the lens with which it can be used, namely, 2", 3", 4", and 5". The CENTRAL Range-finder will accurately indicate the distance from the camera of any object from 2 1/2 ft. to infinity.

Price, complete with fittings for attaching to a camera **£1:15:0** Including stiff leather case.

Obtainable from all Photographic Dealers.

CONSIDER WHAT this means

A COUPLED RANGE-FINDER MINICAM for £11:15:0 only

Yours for 20/7 down and eleven similar monthly payments.

VAUXHALL MINICAM OFFERS

you all the refinements of an expensive camera at a price you can afford. At the same time Vauxhall Minicams are manufactured with the same precision and quality of material as used for the most costly of photographic instruments.

WINTER PHOTOGRAPHY

The f/2.9 anastigmat lens alone makes the camera exclusive for its price, and is ideal for taking those indoor "shots" you have so often wanted to experiment with—Vauxhall will produce prints that will be a delight to yourself and your friends.

Remember, last year, those lovely Autumn landscapes you so often wished you could record—Vauxhall will bring the warmth of those golden tones to your snap album. Send for one of these remarkable cameras on 5 days' FREE approval against Full Deposit to value, or call and inspect same. Our confidential Self-Financed Hire Purchase Terms make it possible for you to own this Camera without any noticeable call upon your purse. Our system is a confidential arrangement solely between you and us.

STANDARD MINICAM (without coupled Range-finder)

With f/2.9 anastigmat, micrometer focussing mount, D.A. Compur shutter..... £6:19:6

Ditto, with unique radial focussing..... £7:19:6

Ditto, with Pronto D.A. shutter..... £5:19:6

Or 12 monthly payments of 12/3, 14/- and 10/6 respectively

 32, Lord Street LIVERPOOL 2.

An Episcop for the Home

SHOW YOUR FRIENDS YOUR HOLIDAY SNAPS!

The "K.W." Episkop is a wonderful new picture projector, specially designed for use in the home. It is mainly intended for projecting miniature size prints without having to make lantern slides; it can be used also for projecting cigarette cards, postage stamps, postcards, small flat objects, book illustrations or colour prints of any kind.

K. W. EPISKOP

With Projection lens, £3 : 5 : 0

With Anastigmat Projection lens £5 : 5 : 0

"K.W." Episkop Lamp, 100 watts, 5/- extra. (Please state voltage when ordering).

Rigid Silver Surfaced Screen, 26 x 26 in., with eyelets for hanging, 10/-.

48 PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

GREAT SALE OF CAMERAS at FANTASTIC BARGAIN PRICES

Never in photographic history have such stupendous offers been made! These items are being sold at 30 to 70% below ordinary bargain prices, which means that you get an instrument for a few shillings which originally cost pounds, and they're all in good condition—even the lenses and shutters are worth more than we are charging for the entire outfits. We are getting absolutely nothing out of them—our only profit will be the space this clearance will make for fresh stocks of new apparatus already waiting to be put on our shelves. The abnormally low prices do not allow easy payments or exchange allowances. This is only the first of a series of such great bargain clearances. Keep an eye on this page during the next few weeks—it will mean the saving of pounds to you. Note: every instrument is second-hand.

FOR MORE BARGAINS VISIT OUR CASH BARGAIN STORE AT 1a, AVERY ROW, W.1.

ALL IN THIS SECTION 9/6 CASH

ILFORD

**HYPERSENSITIVE
PANCHROMATIC PLATES**

Made in England by **ILFORD LIMITED, ILFORD, LONDON**

There's a different world at your doorstep—waiting to be pictured in a way that's as original as it's fascinating—*your* world after dark. No longer now need you put away your camera when the sun goes down, for Selo H.P. Roll Film and Ilford Hypersensitive Panchromatic Plates make it as simple for you to take snaps by night as by day. What a chance to obtain results that are really out of the ordinary—either in the brilliant highways, with their flashing signs, or in the dimmer byways where lovely pictures often linger—unexpected and exciting. In your own house too, with a simple arrangement of light, you will secure unrehearsed home snapshots and charming portraits. Take out your camera to-night.

FINE and WARM

It is an interesting psychological fact that most people respond more readily to a photograph in warm tones than to one of the more conventional cold black variety. There is a certain appeal about the cheerful warm image, a subtle richness and glow, that catches the eye and flatters the subject and makes a genuine picture out of a snapshot.

Unfortunately, as you know, for certain technical reasons warm-toned pictures—more especially warm-toned enlargements—used to be more difficult to make than ordinary ones. That was, until "Bromesko" paper came along.

"Bromesko" made a clean break with tradition by being the *first warm-tone Bromide paper*.

The advantages of both kinds of papers are

united in "Bromesko." On the one hand, warmth of tone and rare beauty of image. On the other, Bromide paper speed and ease of manipulation, economical Bromide prices. "Bromesko" is, in short, not only a new paper but a new kind of paper.

Whether you are entering some cherished enlargements for the club exhibition or simply having some pictures made for home decoration, try "Bromesko" and give your negatives the treat of their lives.

'BROMESKO'

Assorted "Bromesko" Packets—the best way of trying out "Bromesko." Three varieties of grade and surface in each 12-sheet packet. Size : 8½ in. by 6½ in. 3/- per packet. Four assortments. From your Kodak Dealer. Ask him for free "Bromesko" Booklet or write to Mr. A. P. Taylor, Dept. 57B.

Another fascinating Wallace Heaton competition

"SHIPS AND THE SEA"

A subject near to the heart of most amateur photographers. It offers pictures of the greatest possible variety—the busy harbour at high tide, the landing of the catch, boats sailing out into the heart of the sunset, gulls hovering around the mastsheads, pictures of the sea itself in angry or "millpond" mood. Keep your shots within the sphere of "Ships and the Sea" and good photography will do the rest in the final judging for the prizes. Any amateur may enter, using any camera or materials, and there's NO entrance fee.

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final.

AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA or MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.)

Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton

With 200-watt lighting. Pictures 10 ft. wide easily obtainable. Flickerless projection, sprocket fed. Threading one side only. Single nut tilting device. Works off 110 volts. With lamp, plug, flex, adapter and one empty 300-ft. super reel.

Cash price £15 : 0 : 0
24 monthly payments of 13/5.

Autumn and Winter photography is easier with a 'ROBOT' because:

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position — no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and supersedes range-finders.
- Takes up to 50 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 sec. to 1/500th sec.—and all intermediate speeds.
- Weighs 14 oz.—just heavy enough to be held comfortably without risk of movement.
- Overall size only $4\frac{1}{2} \times 2\frac{1}{2} \times 2$ in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight-loading spoons available.
- Camera has stainless steel body, covered black morocco.

Over £6 Saved! Brand new, as originally issued by makers.

Zeiss Ikon Super Ikonta (Model 530/15)

With famous Zeiss Ikon range-finder, Zeiss Triotar f/4.5 lens, Kilo shutter, 1/5th to 1/100th sec. T. and B., and delayed-action, etc. Most attractive size pictures.

Attractive Picture Sizes.

For 8 exposures $4\frac{1}{2} \times 2\frac{1}{2}$ in. on normal spool, with option of $16\frac{1}{2} \times 2\frac{1}{2}$ by removable mask. Full size is most pleasing shape and generous dimensions; smaller is amply big enough to give good pictures of itself, yet exceedingly economical.

Makers' List Price £16:5:0

OUR PRICE £9:17:6

12 monthly payments of 17/4.

—meaning paying for your purchase over a period arranged to meet your special convenience—reaches its greatest measure of popularity at the WESTMINSTER. The Westminster Out-of-Income Plan has distinctive and exclusive features. It is notably easy of understanding, essentially helpful and friendly —with privileges and safeguards obtainable at the Westminster Only. You certainly ought to know about the Westminster Plan.

The NEW ROLLEIFLEX

In this new model the 6×6 cm. ROLLEIFLEX for 12 pictures on usual $3\frac{1}{2} \times 2\frac{1}{2}$ spool becomes more than ever automatic, revealing a still higher standard of optical and mechanical perfection. Only one action is now needed to—

(1) set the shutter; (2) safeguard against either blank or double exposures; (3) to give delayed action. There are also, amongst other improvements, new controls for shutter speeds and lens apertures, with magnified readings. The reflex hood is fitted with larger magnifier, and there is a double magnifier and additional mirror for eye-level use. Lens is f/3.5 Tessar, with Compur Rapid shutter speeded to 1/800th sec.

Price £31:5:0

12 monthly payments of 54/8, 24 of 27/4.

NOW READY! B. W. PHOTOGRAPHIC
1/6. Post free 17½. **DIARY—1938**

VOIGTLANDER BRILLIANT

A highly popular camera now offered in new de luxe form. Body moulded of special unbreakable material, comprising built-in hold-all for filters, supplementary lenses, etc. Takes 12 pictures $2\frac{1}{2}$ square on normal $3\frac{1}{2} \times 2\frac{1}{2}$ spool. Automatic film wind prevents all risk of overlapping. A special "sports" direct-vision finder greatly facilitates rapid working.

F/6.3 Voigtar, 3-speed delayed action shutter..... £4:5:0
9 monthly payments of 10/-.
F/4.5 Voigtar, Prontor II shutter, with delayed action 12 monthly payments of 10/6. £5:12:6

Everything for the Miniaturist

Our stocks at London and Bromley cover all Photographic and Movie needs, and Miniature Equipment is a Speciality. Why not compare our part exchange offers against new apparatus? We think you will be pleasantly surprised. Easy Terms are available without delay, a written guarantee of after-service and every approval facility. Our staff are out to help you with unbiased technical advice, and give personal service without high-pressure salesmanship.

ENLARGERS.

We stock Ensign Magnaprints, Leitz Valoy and Focomat, the Auto-Vertex, Fam, Filmarex and Miraphot. Why not call, inspect and compare?

PLATE CAMERAS.

Makina I, f/2.9 Anticomar, slides and F.P.A.	£8	8	0
Zeiss Trona, $\frac{1}{4}$ -pl., f/4.5 Tessar, double extension, slides, F.P.A.	£7	7	0
Contessa Nettel $4\frac{1}{2} \times 6$ cm., f/4.5 Tessar, R.F. holder and case	£7	7	0
Schneider $3\frac{1}{2} \times 2\frac{1}{2}$, f/3.5, Compur D.A.	£5	15	0
Venus Wafer Thin $3\frac{1}{2} \times 2\frac{1}{2}$, f/4.5 Meyer, Vario, 3 slides	£4	15	0
Zeiss Miroflex 9×12 cm., f/4.5 Tessar, slides, F.P.A., case	£19	10	0
Mentor Sports Reflex $3\frac{1}{2} \times 2\frac{1}{2}$, f/4.5 Meyer, F.P., 3 slides	£9	17	6
Soho Precision $3\frac{1}{2} \times 2\frac{1}{2}$, Zeiss Proxar 22-cm., Zeiss W.A. 8.5-cm., on panel, Zeiss Proxar 29-cm., 3 double dark slides, F.P.A., Riteway R.F. holder, case for extra lenses. Cost £55. As new	£35	0	0

ROLL-FILM CAMERAS.

Agfa Record $3\frac{1}{2} \times 2\frac{1}{2}$, f/4.5 Apotar, D.A. Compur. As new	£4	15	0
Zeiss Nettar $3\frac{1}{2} \times 2\frac{1}{2}$, f/4.5 Novar, Telma	£3	17	6

PAGES OF
FACTS AND
FORMULÆ

The AMATEUR PHOTOGRAPHER DIARY

AND HANDBOOK FOR 1938

This useful little handbook contains, in addition to the usual diary pages—one week to the page—over fifty pages of facts and formulæ for the keen camera user. Information is given on developing, fixing baths, mountants, and finishing negatives and prints. Numerous reference tables dealing with hyperfocal distances, enlarging, screen distances for lantern projection and exposures are included, as well as sections for exposure records and personal memoranda.

Size $3\frac{1}{2} \times 5\frac{3}{4}$ inches, well printed, neatly and strongly bound in leather cloth, with back loop pencil and round corners.

FRIENDS ! LONDONERS ! COUNTY-MEN !

Lend us your ears ! Go now to judge the Leica,
then to praise it !

At the Camera Club, which, as every man-about-the-Strand knows, is in John Street, Adelphi, W.C.2, we are holding an exhibition of pictures taken by R. G. Lewis with a Leica during a recent Arabian expedition. The pictures accepted by this year's Salon were taken during the same tour, and we feel sure that any time you can spare to visit the exhibition will not be wasted. The pictures are already on view, and will be so until the middle of November.

If you are interested in Leica work, and would care to visit the exhibition, please write to us (at 202, of course) for an invitation card and catalogue. These will be sent free by return. Should you wish to take a friend, or friends, let us know and the appropriate number of cards will be sent you.

In conclusion, we would like to say how deeply appreciative we are of the co-operation of that most distinguished of photographic societies, the Camera Club, and also wish to place on record our complete satisfaction with the performance of the Leica in what could not but be described as adverse conditions.

R. G. LEWIS, The Miniature Camera Specialist
202, HIGH HOLBORN, LONDON, W.C.1

THESE "quick action" FEATURES
GIVE THE NEW

Rolleiflex

still
greater
versatility

1. AUTOMATIC FILM WIND

2. NEW LOADING DEVICE

3. MILLED DISC CONTROLS

4. SELF-TIMER

5. IMPROVED PEEP WINDOW

6. EYE-LEVEL FOCUSING VIEWFINDER

7. COMBINED DEPTH OF FOCUS SCALE & FOCUSING KNOB

1 AUTOMATIC FILM-WIND, which in one action automatically (a) sets the shutter, (b) prevents double or blank exposures, (c) sets the built-in self-timer for delayed action.

2 LOADING : No red window is fitted, for you merely load your film in the ordinary way, crank the transport handle like an ordinary cine camera, when the film automatically stops at No. 1 ready for the first exposure to be made and the number is registered in the counter window.

3 IMPROVED CONTROLS for manipulation of shutter speeds and lens apertures in the form of two milled discs which can be operated with the greatest ease whilst the camera is in the taking position.

4 SELF-TIMER (built-in) : Is automatically set after each exposure, allowing a delayed-action period of 12 seconds. (The self-timer need not be used, but is all ready set for use if desired.)

5 PEEP WINDOW : Shows shutter speeds and lens readings in magnified form by means of a cylinder lens over the peep window.

6 REFLEX HOOD is fitted with large magnifier and for taking pictures at eye-level the object is focussed through a mirror and double magnifier combined.

7 Depth of focus and focussing knob combined.

8 EXPOSING : After each exposure has been made the film is wound for the next exposure—the shutter being set automatically at the same time.

9 LARGER APERTURE FINDER LENS now f/2.8, giving, of course, a brighter screen picture.

10 ZEISS TESSAR f/3.5 lens.

11 COMPUR RAPID SHUTTER speeded to 1/500th sec. and Bulb.

12 EMBODIES all the well-known Rolleiflex features, including 12 pictures $2\frac{1}{2} \times 2\frac{1}{2}$ on a $3\frac{1}{2} \times 2\frac{1}{2}$ roll film for 1/-—seeing your picture full size right way up all the time on the glass screen, engraved exposure plate, etc.

Price £31 5 0 Ever-Ready Case £1 17 6

***Looking into the
past and into the
future . . .***

When buying a camera it is advisable to look both ways—into the past and into the future. Consider the past reputation of the manufacturer, and look ahead. How long will you be proud of your camera when it has ceased to be a novelty? Zeiss Ikon have a history to be proud of and a reputation to live up to in the future.

Remember that the Contax, and indeed all Zeiss Ikon miniature cameras embody the very latest developments in design applied in the light of practical experience. So carefully and exactly are they tested that with all Zeiss Ikon 24×36 mm. miniature cameras sold in Great Britain and Ireland at current listed prices a written guarantee for three years is available.

The Contax is the precision miniature with view-finder and distance meter combined in one eyepiece, which greatly adds to the speed and convenience of manipulation. A choice of 15 interchangeable Zeiss lenses, with apertures from f/1.5 and focal lengths from 1½ in. to 20 in. is available, and will tackle the most diverse subjects. The metal focal-plane shutter is impervious to climatic conditions, and with its top speed of 1/1250th second will arrest the movement of the fastest sports subject. The detachable back facilitates loading and cleaning, and permits plates to be used for scientific work. The Contax is provided with a delayed-action "take yourself" release and many other features.

CONTAX

Write for a copy of our 96-page book, "Contax Photography," and read all about it for yourself, or ask your dealer for a demonstration.

Vol. LXXXIV. No. 2554.

BOTH the amateur cinematographer and the lantern-slide worker are now in their element. The season for their special activities is well started, and the longer evenings provide an additional excuse for displays of lantern slides and films recalling the summer holidays. The photographic societies are also steadily getting into their stride for the winter season and programmes of lantern and ciné shows occur more frequently in the fixture lists than in any previous year. These topical matters will be the main subject of much of the contents of next week's *Amateur Photographer and Cinematographer*, which will be a special Ciné and Lantern Number, and those readers who are not already interested in these matters will speedily want to make slides and films when they realise the immense advantages they offer over ordinary prints for the entertainment of their friends. In addition to many practical articles in our next issue dealing with various phases of lantern and ciné work—a review of the current projectors for all kinds of slides and films for the amateur will be a feature. It will be published on Wednesday, October 27th.

The Future of the R.P.S.

Dr. Spencer, the President of the Royal Photographic Society, waxed eloquent about the Society's future in the course of his presidential address last week. He refuted the idea that the Society was behind the times and narrow in its outlook, though if it adopted every suggestion that its critics made it would be like Leacock's hero who mounted his horse and rode off rapidly in all directions. At the same time, to meet the demands of progress and

TOPICS of the Week

AUTUMN SUNLIGHT IN THE PARK.

Pictures of this type, which depend largely for their pictorial effect on cast shadows, are readily obtainable at this time of year when the sun is low.

to make for greater elasticity and efficiency, he indicated certain changes which were being put before the members. One of the new proposals was that a class of junior members should be created, persons not over twenty-five years of age, who would pay an admission fee of only half a guinea and a subscription of one guinea, and would enjoy certain specified, but not full, rights of membership. It was also proposed that the secretaries of the various groups within the Society should automatically be members of Council, and that instead of past-presidents remaining members of Council indefinitely they should do so only for four years after leaving office. Dr. Spencer also mentioned the negotiations, which are proceeding favourably, for new premises in Kensington. The premises in view are admirable in every way for the Society's purposes, with abundant accommodation for offices and work-rooms, a meeting-room twice as large as the present one in Russell Square, ample provision for library and museum, and an excellent lounge or common-room where members could meet socially, and on the walls of which would be continually fresh exhibitions of work.

Reminiscence.

W. B. Ferguson, K.C., will be greatly missed. Although his interests were on the technical side of photography, he never despised the pictorial side, and he was a diligent attendant at meetings of the Pictorial Group. Sometimes it might have been thought that he was slumbering in his favourite chair by the fire, but the mention of some old process or method of development would bring him to his feet with a store of advice and

recollection. He was a diligent reader of this journal for many years. Older readers of *The Amateur Photographer and Photographic News* as it was then will remember that there used to be a page of causerie under the name of "The Magpie," and for years it was customary for that page, like Sam Weller's valentine, to end up with a little "poetry." These poor essays in verse greatly interested Mr. Ferguson, who for years afterwards, whenever he met the writer, would enquire when "The Magpie" was going to sing again?

Through Morocco by Motor Bus.

Mr. James Shaw, one of the best of lantern-slide makers, has been getting pictures in Morocco, and he told an R.P.S. exhibition audience how he had covered 1,500 miles of that country, not by camel, but by motor bus. He said that by no other method of progression could he have seen as much. During his holiday in Morocco he exposed about 600 plates and films, and from that number he selected about 100 lantern slides. He did some violence to his feelings

by colouring a number of them, but he said that was really the only way to give some idea of the country, a paradise for colour. In the little primitive towns he did not find that the people objected in the least to being photographed, and he had no difficulty in getting all the pictures he wanted. His objective was the town of Marrakesh in southern Morocco, and here, he said, it was well to do what one did in Venice, wander about in the alley ways with no definite aim, being pretty sure that the subject of one's dreams was round the next corner. Then, lost in this maze of a Moorish city, it was a simple matter to show a coin to any street gamin, who would lead one back directly to one's hotel.

In the News Film.

The experience of one who was called upon to assist (as a subject) in one of the new kind of news films may be of some interest. The idea was to show how expeditiously a certain piece of handicraft could be carried out by modern methods as compared with the clumsy methods of years gone by. A table

was rigged up with a black cloth over it, and the camera was arranged so as to "breathe down the neck of the subject." It took a good quarter of an hour to get in focus alike the subject's head and the task on which his hand was engaged, but at last it was just right. The ecstatic shout of the operator when he got it right caused such a shock as nearly to send it wrong again. Then the movement began. The consciousness of a camera looking over one's shoulder had the effect of heightening the speed and lessening the accuracy. But still some sort of result was obtained, and the subject felt that his feet were launched on the path to stardom—if there is a path and if one does launch feet. Various people have asked him what fee he received and he tells them proudly that it was at the rate of a leading star, that is, about £500 a week, but it was only for a quarter of an hour, so he leaves them to work it out. Then late that same night he got an intimation that the film had been ruined by light in the dark-room and it would all have to be done over again next day.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Chloro-bromide Developer.

As I experiment with different brands of paper I am wondering if you can give me an M.Q. developer for chloro-bromide papers, as I cannot make up all the formulae recommended by the makers. Is there a better one than M.Q.? F. E. (Barking.)

Presumably you experiment for the purpose of finally deciding on a paper or papers to suit your requirements. We would suggest two things. The first is that you are not likely to work any particular paper to the best advantage until experience has taught you its characteristics; and the second is that you may not get the best results from a paper unless you follow the procedure laid down by its makers. It follows that you may reject a paper because your trial of it has not given it a fair chance.

However, here is a suitable M.Q. developer:—

Metol	60 grs.
Hydroquinone	240 grs.
Sodium sulphite	3½ oz.
Sodium carbonate	3½ oz.
Pot. bromide	250 to 700 grs.
Water to	80 oz.

It is better to omit the bromide and to add a quantity within the proportions of the limits stated, according as you wish warmer or colder tones.

Another single solution for the purpose can be made with glycin, although this is not necessarily better than the M.Q. Much depends on the brand of paper. Here is a formula:—

Glycin	½ oz.
Hydroquinone	½ oz.
Sodium sulphite	7 oz.
Sodium carbonate	6½ oz.

Pot. bromide	75 grs.
Water to	80 oz.

Now that colder weather is approaching you must remember that hydroquinone becomes less and less active as the temperature falls, and with chloro-bromide papers particularly it is advisable to keep solutions up to a temperature of at least 65 degrees Fahr.

Pyro for Slides.

Some time ago you gave a formula for making lantern slides, but I have lost my copy of it. Can you repeat it, please?

V. L. L. (Burton.)

We do not know to which particular formula you refer, but we know of no better one than can be prepared from the three stock solutions following.

A. Pyro	1 oz.
Sodium sulphite	2 oz.
Citric acid	40 grs.
Water to	10 oz.
B. Ammonia (.880)	1 oz.
Water to	10 oz.
C. Ammonium bromide	1 oz.
Water to	10 oz.

Using warm-tone plates, you might commence with the following working solution: A, 30 minims, B, 60 minims, and C, 30 minims to each ounce of water. Exposure should be arranged so that development is complete in not more than three minutes at 65 degrees Fahr. Warmer tones are obtained by increasing the proportion of C only. The slide can be judged properly only by projection, and not visually.

The Autumn Sales

and the AMATEUR'S OPPORTUNITY

At the beginning and end of the busiest photographic season of the year the big firms dealing in apparatus usually decide to dispose of as much of their stock as possible, in order to be prepared to receive new models and new season's stocks when the time comes around. The article that follows contains some points of interest for every amateur.

THE present time of year is a good one for the amateur photographer in search of bargains. To the man of limited means many opportunities are now offered whereby he can gradually build up a comprehensive photographic outfit for himself without making too heavy demands upon his capital.

Not Junk.

A rapid survey of the lists usually offered of these sale bargains will prove to the discriminating amateur that the goods listed are not a collection of junk, but genuine photographic apparatus, capable of being of great service to him. Not the latest outfits on the market, perhaps, but then there must be some reason for the modest price asked, and in a good many cases it is because the instruments have been superseded.

The modest amateur will not feel inclined at the outset to spend about forty pounds for his camera, even if he has that much money to play with, and the solution to the problem of getting the expensive instrument he covets is by a system of exchange and discriminative buying, especially when sales are on.

Gradual Building.

Let us take the case of the man who has five pounds to spare for the purchase of his camera. He will be tempted by the large-aperture lenses advertised on cameras of this price. And it is possible to obtain a new camera with an $f/4.5$ lens for about five pounds. Now that same five pounds will purchase a good second-hand instrument with the same lens equipment and a Compur shutter, with the difference that a well-known and valued make of lens may be included. To a great extent the value of a camera depends on the lens and shutter equipment, and the definition of the lens, especially in cameras taking smaller sizes, is vital.

The purchase of a good second-hand camera with a well-known lens from a reputable dealer at sales time is the first step to the building up of the worker's equipment, but only the first step. The next is to lavish every care on the instrument now in possession, remembering that the object is

to sell it at the highest possible price in due course. This is usually best accomplished through the medium of a private sale, either by advertising it in the small advertisements or by selling it to one of one's photographic friends. By this method it is sometimes possible to get as much as one paid for the instrument—in fact, with extra good luck, it may be that a little profit is gained.

Going Forward.

During the time the first camera has been in use, assisting in the accumulating of experience, the worker will note the new patterns of instrument that have been appearing on the market, mostly in the miniature classes, and with an enquiry or two at his photographic dealer's he will have little difficulty in handling quite a number of these, so that by the time the next sales list comes along he has a pretty good idea of what he would like to possess.

By this time a little more money has accumulated and he may perhaps be able to add to the sum for which he has sold his other instrument and bring his total up to ten pounds. For this he can acquire a miniature camera with quite a number of refinements, and he will find many listed in the sales lists.

They will not, of course, be the latest model of the particular make he has in mind; indeed, they may be the first model out, but their fundamental principles are the same, and he will have every opportunity of getting experience and efficiency in handling before he ventures on to a model with all the latest refinements.

There are workers who have never possessed a new camera in their lives. This is no drawback. The new camera is a splendid thing to possess, and its glistening and pristine freshness is a delight, but it will not take any better photographs than a good second-hand one, especially if the latter has been well cared for.

Other Opportunities.

It often happens that the possessor of a miniature camera, especially one of the more modest type, wishes he possessed a larger instrument for amusing himself at home with such

things as table-top work, still life, or even flower photography in the garden, where he can develop each plate as he exposes it. The sales lists abound in this type of outfit. It is possible to obtain a quarter-plate reflex or double-extension hand and stand camera for a perfectly ridiculous price, an instrument which will give good service for many years to come, with a good lens and shutter, and slides, film-pack adapter and roll-film adapter—an instrument which will give an untold amount of pleasure, can be used for copying enlargements made from your miniature negatives which have needed some after-attention, and can even form a part of your enlarger if you want a variation in sizes.

Other Apparatus.

Of course, these lists are not just confined to cameras. Enlargers can be found therein, and the older type of horizontal enlarger may be a god-send to a young worker using sizes not less than $3\frac{1}{2} \times 2\frac{1}{2}$. The fact that all the moderns prefer the vertical type does not make the old horizontal instrument any the less serviceable, but it makes its second-hand value less, and here is the modest worker's opportunity. The versatility of these instruments is really remarkable, and the worker who will take the trouble to evolve little gadgets for his instrument will find himself able to enlarge even miniature negatives satisfactorily.

The still photographer anxious to try his hand at ciné work is also very well catered for. Some of the older patterns of ciné cameras are very low in price. True, they have only modest aperture lenses, but the worker can afford to wait for the better weather before he tries his experiments, and if he finds that he prefers to stick to still work, well, the discarded camera will not have cost him much.

One note of warning must, however, be sounded. Do not buy from firms with no reputation. "Approval" is almost always a concession from the better firms, and it is worth taking advantage of, and many firms also issue a guarantee of mechanical perfection with their better-class sale bargains.

Following

By
H. W. ROBINSON.

The Meet.

THERE is no sport more prolific in picture possibilities than that of fox-hunting, for whereas most kinds of sport have been photographed from nearly all possible angles, there are thousands of pictures in the hunting-field which have never yet been recorded by the camera.

This field, therefore, offers unlimited scope for the amateur and also for the free-lance pressman, and is more or less left alone by the London press photographer.

It is true that a meet at the house of some important personage, or one at which notable people "in the news" are expected to be present will draw a

The Huntsman putting Hounds into Covert.

few London press photographers, but most of them will not follow beyond the first covert, and it is generally after this that the most striking pictures can be obtained.

It is advisable to wear the strongest boots or shoes, and clothes that do not matter, for mud, barbed wire, hedges and even streams may have to be negotiated.

Many pleasing pictures can be obtained at the meet even if the surroundings seem almost bare of picturesque features. But when, as is often the case, the meet is in a village square, not only is the setting pictorial, but the crowd, attracted by the event, affords plenty of material for good snaps—particularly if it is a sunny morning.

The move-off, too, generally provides a picture, but the photographer must be prepared for possible disappointment, for having chosen a good position with suitable background there is always a

Moving off.

chance of an obstruction at the last moment, such as a horse-box stopping almost on your toes, or perhaps a late arrival at the meet riding a lively horse with red ribbon tied to his tail stops too uncomfortably close to wait for the hounds to pass.

The best thing to do is to choose a position and trust to luck. If the hounds come into range long before the huntsman, so that the hounds would appear larger than the huntsman's horse, save the plate or film, and perhaps the followers may present a better picture.

A picture of the hounds spread all over the road with the huntsman and followers a long way back and probably out of focus does not look well, neither does one of the huntsman and followers with about three hounds, the other hounds having passed the photographer before the horses came near enough.

The next chance of a picture generally comes when they reach the first covert. If you have gone to it straight from

The Hounds with a Camera

the meet ahead of the hounds, you can get a shot of the huntsman sending them in to draw. This will probably require the highest shutter speed on your camera, as the hounds do not wait to be asked twice, and generally go into the wood like greased lightning.

From now on it is most important not

The Field in full Cry.

"Gone to Ground."

to put yourself into any position where you might head the fox; country people know this, but town dwellers might not think of it, and if they do accidentally set foot "where angels fear to tread" they will most likely hear something to their disadvantage, as hunting people are apt to be somewhat downright on these occasions.

When the fox goes away from covert, action pictures can be obtained of the field at full gallop, and if the followers are there in large numbers it is not necessary to be very close to them to obtain an effective picture.

To attempt to describe even a small percentage of the further pictures which present themselves would occupy far too much space, but they are there to be taken by anyone who loves a day in the country with plenty of exercise. One picture which may, however, be mentioned, is that of the fox himself, not too easy to obtain for obvious reasons, but therefore all the more satisfying an achievement.

The best way is to attend as many meets as possible and find out by observation the likely runs of the fox. Do not rely too much on the information of others, because a well-known crossing-place soon becomes a barrier of talkative human beings which effectively stops the fox using it, and he goes some other way.

Lastly, the means of getting about. I have tried a car and a cycle, but, although slower and more painful, I prefer to follow on foot, thus having both hands free to manipulate my camera without delay when the opportunities arise. For this reason also, a light-weight camera (roll-film or film-pack) with a rapid shutter is best—and fast panchromatic material is advisable, as there is a lot of colour in the autumn landscape as well as in the hunt itself.

Homeward.

The Cause of all the Fuss.

Readers' Hints, Tips and Gadgets

A SIMPLY-MADE ROLL-HOLDER ADAPTER.

It is generally considered that roll-holders can only be fitted to cameras using metal dark slides. The adapter-frame shown here, however, makes it possible to fit a $3\frac{1}{2} \times 2\frac{1}{4}$ roll-holder to the back of any camera using wooden slides, irrespective of the size of the camera.

A rectangle of plywood (A), which just slips into the camera as would a dark slide, is first cut, and in it is made the rectangular opening (W) having the dimensions of the film in the roll-holder and being central to the lens. Two strips of hard wood (B) with the channels (C) taken from either inner edge are now prepared and are screwed to (A), the width of the roll-holder apart. The piece (E) is now inserted, jointed with the strips (B) as shown, to preserve light-tightness, and held by $\frac{1}{4}$ -in. screws through (A), as also are the strips (B).

Test for easy running. The holder should slip nicely in between the strips, not too tightly, but certainly not too loosely.

Next with a sharp chisel make a small channel at (F) and in it glue a thin strip of velvet; the special light-trap strip of velvet taken from a film pack is admirable for the purpose. Also fit (with glue) a strip of soft felt or thicker velvet at (G). If everything fits tightly these two "straps" are quite enough to maintain light-tightness.

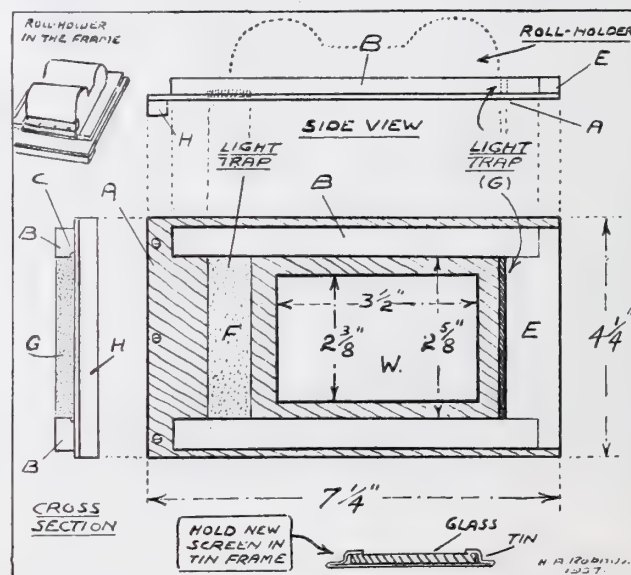

Now slip the whole adapter into the camera and fit the strip (H) on the underside of (A) and tight up to the camera body. This is intended to prevent any danger of light getting in between (A) and the camera, and it also has the effect of preventing (A) from warping. (E) at the farther end has the same effect, and these pieces together with the strips (B) make the adapter into a very rigid frame.

The frame should be "finished" with a dead black in the front, but can be stained as desired on the back. The dimensions shown are for a $3\frac{1}{2} \times 2\frac{1}{4}$ holder fitted to a P.C. sized back.

With regard to focussing. The new focal plane is not likely to be in register with that of the camera in its original condition. It is simplest therefore to make a new ground-glass screen (which the writer has done) to slide into the frame alternatively with the roll-holder. The new screen is simply a tin frame as shown holding the glass, care being taken to get it in good register with the film. To do this put a film pack into the holder and with the frame out of the camera lay a slat of wood across the opening (W). Put a screw through the slat, and screw it down till the point just touches the cover-paper of the pack. Now remove the roll-holder, replace it with the focussing screen, and adjust this until the ground side of the glass just comes into contact with the screw. Parallelism can be assured by moving the slat about over the frame and checking that wherever it is placed the screw still just touches the glass.

Once the focussing screen is adjusted the focussing scale can be brought into line with the new register. This is most simply done by carefully focussing a distant object and making a new index-mark on the camera-front or moving baseboard opposite "Inf." on the scale. It will then automatically read correctly for all distances.

H. A. ROBINSON.

GLAZING SMALL PRINTS.

A QUICK and convenient way of glazing prints up to $3\frac{1}{2} \times 2\frac{1}{4}$ size may be found by making use of the domestic geyser. These water-heaters are to be found in many homes and usually are chromium-plated, a surface admirably suited for glazing.

Prints squeezed on this surface will be found to drop off in about a minute and a half with quite a good gloss on them.

A wipe down with a damp cloth is first advisable and the prints need not be soaked in any special solution but just wetted first. The heat from the geyser dries them rapidly and the prints will fall off on their own accord.

R. B. W.

RETOUCHING GLAZING FLAWS.

It occasionally happens that the emulsion of a print or enlargement is accidentally torn or cracked when removing from the glazing sheet. Provided the tear is not too large it can be repaired with nail varnish, and will be almost inconspicuous and as highly glazed as the rest of the surface. Of course, a "natural" shade of varnish is best, but weaker shades of pink do not show on a black-and-white print.

Small spots of unglazed gelatine, caused by dust on the glazing sheet, can also be easily "spotted out" by nail varnish.

STEPHEN MOGRIDGE.

FAREWELL TO THEE, BLITHE SPIRIT!

"Leave her, Johnny, leave her!" sang the old shell-backs when their long voyage was done, and their sweet-lined clipper safely docked. We, too, have sailed an imaginary barque for many months past, and our hearts are heavy now that the ghost of a song tells us that it's time for us to leave her. Our craft, though, dared no rough seas, but the uncharted ocean of our thoughts, as we planned each week fresh things to fill this space for your delectation, for you, who by your patronage have lifted R. G. Lewis to its lofty eminence in the photographic world.

That vessel was our style of advertising, good masters! But others saw her lines, admired and envied the success she won, and, alack and well-a-day, flattered her all too sincerely by assiduous endeavours to copy her! So now we are faced with a major problem, in the solution of which we need your help: whether 'twere wiser to do as we've done, or completely to abandon our light-hearted style in favour of a strictly utilitarian advertising programme.

Now you, O gracious and gentle reader, are the one we seek to please, and 'tis to you that we turn in our dilemma. Please, of your abundant and never-failing kindness, send us a card, letter, or even telegram, to tell us what you think! Don't leave it to the next man—it's your opinion we need! In the meantime, whatever our advertising may do, our reputation endures, so "Try 202 for Service!"

WE ARE THE WORLD'S ONLY ALL-MINIATURE FIRM!

In the several-thousand-poundsworth of miniature cameras that we have available at the moment, there is practically every model of every camera to be found. If what you are waiting for is not shown in the small selection given below, why not write and ask us whether we can meet your requirements? All apparatus is guaranteed, and we should be delighted to take your present miniature in part exchange, and to spread the balance payable over hire purchase.

LEICAS:

15-cm. f/2.3 Astro for the Leica, with reflex attachment. Cost £95. As new.....	£55 0 0
Leica IIIa, f/2 Summar lens, E.R. case. As new.....	£35 10 0

Leica III, black, f/2 Summar, E.R. case. As new.....	£31 10 0
Leica III, chromium, f/3.5 Elmar, E.R. case. As new.....	£24 17 6
Leica III, black, f/3.5 Elmar, E.R. case. Practically as new.....	£23 17 6
Leica II, chromium, f/3.5 Elmar. Indistinguishable from new.....	£22 15 0
Leica II, black, f/3.5 Elmar, E.R. case. Practically as new.....	£19 10 0
Model I, interchangeable, f/3.5 Elmar, case. Excellent condition.....	£10 10 0
73-cm. f/1.9 Hektor Lens, latest rectilinear focussing. As new.....	£19 17 6
Another, as above, but non-rectilinear. Excellent condition.....	£17 17 6
35-cm. f/3.5 Elmar, nickel. As new.....	£6 10 0
5-cm. f/1.4 Zeiss Biotar, coupled for Leica. As new.....	£22 10 0
4-cm. f/1.5 Meyer Plasmot for Leica. Cost £26. As new.....	£10 17 6
5-cm. f/1.9 Dallmeyer Super-Six, coupled for Leica.....	£9 17 6

CONTAXES:

Contax Model III, f/2 Sonnar, E.R. case. As new.....	£42 10 0
Contax Model II, f/1.5 Sonnar, E.R. case. As new.....	£55 0 0
Contax Model II, f/2 Sonnar, E.R. case. As new.....	£42 10 0
Contax Model I (this year's pattern), f/2 Sonnar. As new.....	£32 17 6
Contax Model I, as above, but fitted f/2.8 Tessar.....	£25 17 6
Contax, as above, but fitted f/3.5 Tessar.....	£23 17 6
Contax, old non-slow-speeds model, f/3.5 Tessar. Good condition.....	£14 17 6

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS:

Super Ikonta Model 530/16, latest improved model with film wind stop, f/2.8 Tessar, case. As new.....	£21 15 0
Super Ikonta 530, f/3.5 Tessar, Rapid Compur, case. As new.....	£14 10 0
Super Ikonta 530/2, f/4.5 Triotar, Klio shutter. As new.....	£8 5 0
Baldaxette I, f/2.8 Xenar, Compur, special parallax adjusting view-finder. As new.....	£12 17 6
Ensign Multex II, chromium, f/3.5 Multar, E.R. case. As new.....	£13 17 6
Peggy Model 2, coupled range-finder, film-cutting device, f/3.5 Tessar. Excellent condition.....	£13 15 0

WE WILL SEND

free, gratis and for nothing, a Leica Annual (1937) to each of ten readers selected at random from those good enough to respond to our appeal for opinions contained in our heading. Also, when tendering thanks to all those who are kind enough to write to us on the subject, we will, if desired, send any or all of the following interesting brochures:—

"Leica, the Camera of Modern Times" (latest edition).

"Miniature Camera advantages with Small-size Pictures."

"Make sure of the exposure before you shoot!"

BEHOLD THE MULTIFAX

This, lords and ladies, is the enlarger that has annoyed the photographic trade! Frankly, it sometimes amazes us when we consider the way in which we, so to speak, pip the others at the post when it comes to being first with the latest miniature innovations!

This time, however, we have more than brought home the bacon! The Multifax is already the talk of the town, yet no one had heard about it before we advertised that we could supply the whole range from stock. You already know their incomparable specification, but if you would like full details, please write for a leaflet, which we shall be delighted to send by return.

Prices: (Ideal) for negatives up to 4×4 cm. £9 5 0
For negatives up to 6×6 cm. £13 10 0
For negatives up to 6.5×9 cm. £14 15 0

Ensign

MAGNAPRINT

FINEST ENLARGER VALUE

With Condenser-Diffused Lighting System

Ensign Magnaprint Enlargers give super-speed without loss of quality due to the perfect system of illumination, whereby the light diffused from its source and requiring no adjustment, is concentrated on the lens by a powerful double condenser. By this means, every ray of light coming from the illuminating source is used for the purpose of exposure. Grain, scratches and imperfections in the negative are reduced to a minimum and at the same time excessive contrast is controlled.

The great speed of "Magnaprint" Enlargers can best be realised by the fact that it takes no more than three seconds to make a $\frac{1}{2}$ -pl. enlargement from a $2\frac{1}{4} \times 3\frac{1}{4}$ negative of normal quality. Ensign Magnaprint Enlargers are the perfect combination of light and speed.

RANGE OF MODELS

- V/O STANDARD MODEL**, for all miniature negatives. Enlarges a negative $1\frac{1}{8} \times 1\frac{1}{8}$ in. from $2\frac{1}{4} \times 3\frac{1}{4}$ in. up to 15×12 in. Fitted with ENSAR f/6.3 Enlarging anastigmat ... **£5 5 0**
- V/OL** For use with Leica lenses. As above, but without lens, and with helicoidal focussing device to take interchangeable Leica lenses, including special carrier for 35-mm. film ... **£5 15 0**
- V/OC** As V/OL but for use with Contax lenses ... **£6 10 0**
- V/9M NEW SUPER-SIZE MODEL** for all miniature negatives. Enlarges from 2 to 20 diameters. With friction drive raising mechanism. Fitted with MAGNAR f/4.5 anastigmat ... **£12 10 0**
- V/9L** For use with Leica lenses, as above, without lens ... **£10 0 0**
- V/9C** As above, but for use with Contax lenses. Without lens ... **£10 10 0**
- V/10** For $2\frac{1}{4} \times 2\frac{1}{4}$ in. (6×6 cm.) and smaller. Enlarges $2\frac{1}{4} \times 2\frac{1}{4}$ in. negatives from $3\frac{1}{4} \times 3\frac{1}{4}$ in. up to 15×12 in. With friction drive raising mechanism. Fitted with ENSAR f/6.3 Enlarging anastigmat ... **£8 10 0**

- V/10M** Fitted with MAGNAR f/4.5 Enlarging anastigmat ... **£10 10 0**
- V/11** For $2\frac{1}{4} \times 3\frac{1}{4}$ in. (6×9 cm.) and smaller. Enlarges $2\frac{1}{4} \times 3\frac{1}{4}$ in. negatives from $3\frac{1}{4} \times 4\frac{1}{4}$ in. up to 15×12 in. With friction drive raising mechanism. Fitted with ENSAR f/6.3 Enlarging anastigmat ... **£9 10 0**
- V/11M** Fitted with MAGNAR f/4.5 Enlarging anastigmat ... **£11 10 0**

AUTOMATIC FOCUSING MODELS. Automatically in focus for all sizes. The support column is fitted with an accurately machined cap plate working in conjunction with the lens. The body is light, and on Model AV/11, is moved easily up or down by a friction drive operated by a large white knob.

- AV/O** For all miniature negatives. Enlarges a negative $1\frac{1}{8} \times 1\frac{1}{8}$ in. from $2\frac{1}{4} \times 3\frac{1}{4}$ in. up to 15×12 in. Fitted with DALLMEYER f/4.5 Enlarging anastigmat ... **£9 10 0**
- AV/11** For $2\frac{1}{4} \times 3\frac{1}{4}$ in. (6×9 cm.) negatives and smaller. Enlarges $2\frac{1}{4} \times 3\frac{1}{4}$ in. negatives from $3\frac{1}{4} \times 4\frac{1}{4}$ in. to 15×12 in. With friction drive raising mechanism. Fitted with DALLMEYER f/4.5 Enlarging anastigmat ... **£13 10 0**

Model AV/11
with
Automatic
Focussing

The All-British Super-Speed Condenser Enlargers

Model V/O

Models
V/10 & V/11

A New Super-Size Model—V/9

For all miniature negatives. Enlarges from 2 to 20 diameters. With Friction Drive Raising Mechanism.

With **MAGNAR** f/4.5 Enlarging Anastigmat of 60-mm. focus as fitted to Model V/9M a $1\frac{1}{8} \times 1\frac{1}{4}$ in. negative may be enlarged up to **9 diameters**, but body elevation is provided to enable enlargements up to **12 diameters** to be obtained on the baseboard from selected portions of a negative. If larger enlargements are required the supporting column may be removed and refixed so that the image can be projected on to the floor up to **16 diameters** or even larger.

With **LEICA** or **CONTAX** 50-mm. LENSES as used with Models V/9L and V/9C, enlargements from whole negatives 36×24 mm. may be made up to **10 diameters**, while the extra body elevation enables selected portions of the negative to be enlarged on the baseboard up to **14 diameters**. By rotating the supporting column, enlargements up to **20 diameters** are easily obtained by projecting on to the floor.

The special book-form metal negative carrier is provided with masks for a variety of sizes and is suitable for strip films. A number of small negatives can be assembled in two rows between the glasses and each negative brought into position for enlarging by moving the negative carrier.

For prices see opposite page.

For the Beginner HORIZONTAL MAGNAPRINTS

Model
H/O

Designed on the standard lines of all other Magnaprint Enlargers and at a price to enable anyone to start the very fascinating practice of enlarging with sound and efficient apparatus at a very moderate price.

Model H/O For all miniature negatives. Fitted with ENSAR f/6.3 Enlarging anastigmat £3 5 0
H/1 For $3\frac{1}{2} \times 2\frac{1}{2}$ and all smaller negatives. Fitted with ENSAR f/6.3 Enlarging anastigmat and $4\frac{1}{2}$ -in. condenser £5 15 0

The **CORONET** Projector possesses many exclusive and original features, all designed to give you greater enjoyment at lower cost. For instance:—

**SPECIAL
FEATURE
No. 1**

It is absolutely self-contained. There are no extra resistances or super reel attachments to buy. The complete motor unit, including the motor resistance, slips into the base of the projector, leaving no external pieces whatsoever. Whether you purchase the hand-driven model or the motor-driven model you have an apparatus complete in itself which will take either 30, 60 or 400 ft. reels without any further attachment being purchased.

**SPECIAL
FEATURE
No. 2**

It is sprocket driven. There are no claws. The film is continually in mesh with the sprocket wheel for three frames. **CONSEQUENTLY IT CANNOT DAMAGE YOUR FILMS.**

**SPECIAL
FEATURE
No. 3**

The film traction movement is by means of a 10-slotted Geneva wheel, giving a 9 to 1 ratio, with the result that absolutely flickerless pictures appear on the screen.

**SPECIAL
FEATURE
No. 4**

Exceedingly high screen illumination with a low-priced lamp. By means of an ingenious shutter mechanism combined with a perfectly-designed optical system, the projector gives a brilliantly illuminated picture 40×30 in. at a 10-ft. throw, using only a 15-watt 40-volt lamp, for which renewals cost only 3s. 8d.

**SPECIAL
FEATURE
No. 5**

The Projector is universal. It works on any supply of current, whether it be A.C. or D.C., at all voltages from 100 to 250 volts, without the addition of any extra resistances or transformers.

MOTOR-DRIVEN £9:17:6

HAND-DRIVEN £7:7:0

CORONET Projectors are sold by all good photographic dealers. Your local stockist will be only too delighted to arrange a demonstration entirely without obligation.

CORONET CAMERA CO., BIRMINGHAM, 19

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

The Miniature at School

TO those schoolmasters and schoolmistresses who are the fortunate possessors of a miniature camera there exists a field to develop their abilities, a field as yet largely untouched. The ordinary schoolroom, or the specialist rooms like the laboratory, the workshop, or the art-room, seldom feature in purely photographic collections, and so we can tackle their possibilities with our minds more or less free from preconceived ideas derived from another's work.

Pictorial Suggestions.

The following hints are the result of some experience the writer obtained last winter when he was asked to prepare some lantern slides for a lecture to a scientific society, and later to illustrate the school magazine with topical photographs. The school was a large Scottish Secondary School and its pupils range in age from eleven to eighteen.

Non-scholastic readers will find that the following observations apply with equal force to photographs of men and women at work in factories, offices, etc., or even of one's friends doing things in their own homes.

The chief point to remember is that the photograph is not to be just a

freely from lab. to workshop, to art-room, etc. The entire apparatus used for these illustrations was easily carried in an attaché case. The apparatus used must also be *simple* so that everything may be erected and adjusted with a minimum waste of time—either your own or the pupil's.

LECTURE EXPERIMENT

As the lighting will, almost inevitably, be artificial, you must be absolutely *familiar* with the exposure necessary for your lamps. There is no time to make calculations—still less to over or under expose. In this connection it must be remembered that it is ad-

visable to standardise as far as possible the distance of the lamps from the subject. If you double this distance you must increase your exposure to almost four times.

The apparatus used for these illustrations consisted of a miniature reflex and tripod, the latter being

THE CIRCULAR SAW.

very useful for delayed-action exposures, the lighting being two Photofloods with plenty of cable, and a fitting to enable both to be run off one lamp socket. The last item, but not the least, a lens-hood.

Exposure Considerations.

As a rough guide to those starting this kind of work, all four photographs shown were given 1/10th second at f/5.6 on I.S.S. film, with two Photofloods at about 4 and 6 ft. respectively from the subject. Allowance, however, must be made for the proximity of light-coloured walls and ceiling, and for any daylight falling on the subject. A. R.

AT THE BLACKBOARD.

portrait of the pupil but a photograph of something being done. It is usually impracticable then to bring the pupil and his work to a nicely-lit room where the camera is mounted. The camera must be set up beside the pupil at the lathe, using the scientific apparatus, or whatever gear the job in question may involve.

For portability the apparatus must be *compact* to enable one to move about

CHEMISTRY.

A Dish for Miniature Films

By
L. NUGENT HOPE.

EVERY practical miniaturist is faced at times with the problem of handling strips of one or more films that require to be intensified or reduced. Some time ago I acquired a splendid gadget made of stainless steel, into which the film could be slid, which held it flat without interfering with the surface in any way. I found, however, that this carrier required a whole-plate dish, which meant using far more solution than was required if the film was to be covered safely. A simple dish capable of taking six 35-mm. negatives, either in the carrier or loose, can be made as follows.

A whole-plate celluloid dish, as shown in the photograph, is cut with a sharp knife along the edge of the grooves, cutting the ends square. (Lines AB and CD.) This gives two long narrow dishes, each with one side missing. Clean these sections with a linen rag and acetone. (Cotton-wool leaves fluff on the celluloid and must not be used.) Buy a sixpenny

tube of Durofix, which is a celluloid cement, and cement the two sections together, fitting them one inside the other. The dish should be left pressed together for an hour to fix firmly. So long as there is a strong join it does not matter if the

two sections are cemented at all points of contact. Next run Durofix along the trough (E) left at one side of the dish, where the upper section ends. This can be done quite roughly. Take a paint brush and dip it in acetone and

work the Durofix down into the groove. The acetone will dissolve the Durofix for a moment or two only, but by repeated applications of acetone the groove can gradually be filled from the bottom. Further applications of Durofix and acetone will fill the groove up level with the bottom of the dish. The process should now be carried up each end, clipping the two sections together at the ends, if necessary, while setting. You now have a solid celluloid dish without any internal cracks or fissures. The outside should be sealed together in the same way, both for neatness and to simplify washing. The carrier shown in the photograph exactly fits the new dish and will take a single negative or any number up to six.

How a small dish is made by cutting and re-assembling a larger one.

Silver Intensification for Miniature Negatives

HOWEVER much one abhors messing about with miniature negatives, once processed and dried, it occasionally happens that a much better print could be produced if the negative were intensified—usually either the developing time has been under-estimated or the developer was not fresh, and under-development has resulted.

considerably in contrast and density, while others, even if treated at the same time, are very much less improved.

This leaves physical intensification, which has the advantage that it works by a slow, continuous building-up of the image. This can be watched, and the negatives can be taken out of the solution when the exact strengthening required has been obtained.

For use, one solution only is required.

- | | |
|-----------------------------------|-------------|
| A. Silver nitrate | .. 12 grs. |
| Sodium sulphite (anhydrous) | .. 22 grs. |
| Hypo | .. 60 grs. |
| Water to | .. 4 oz. |
| B. Strong ammonia solution (.880) | .. 19 mins. |
| Water to | .. ½ oz. |
| C. Metol | .. 8 grs. |

These quantities can, of course, be increased proportionately if a larger volume of solution is desired.

Instructions—Important.

To make Solution A the sulphite should be dissolved in about one quarter of the water, and the silver nitrate in about another quarter. Add the silver solution slowly to the sulphite solution, while stirring, and then add the hypo solution; by this time the white precipitate should have dissolved—but the hypo must be added last, or insoluble silver thiosulphate will be formed. Distilled water is best, if available. Solution A can be made up and stored—it

will keep for some time if well stoppered in a dark bottle.

The dish must be scrupulously clean, and preferably made of glass. When everything is ready, dissolve C in A, add B, stir quickly and pour on to the clean, dry negatives in the dish. The negatives can be removed at any time, rinsed and examined, but it is best to leave them in the solution for thirty minutes, rocking from time to time at first, then rinse for ten minutes, wipe and dry.

After about forty minutes the precipitate begins to clear, and all negatives must be out before this. If the bath clears much before this, either a mistake has been made in compounding, or else the sulphite is impure.

The process can be repeated as often as required; indeed, the second application seems to give more intensification than the first.

R. HALMSHAW.

Fig. 1. Print from a seriously under-developed negative.

There are two common methods of chemical intensification in use, but both are in some measure unsuitable for miniature work. All the mercury formulæ utterly spoil any pretensions to fine grain which the negatives may have, while the chromium bleach-and-develop method, though not affecting the grain much, is not always very predictable in its effects. Some negatives—usually those of the thin and detailed type—gain very

Fig. 2. Print on the same grade of paper, from the negative of Fig. 1 after intensification.

Modern Miniature Cameras

THE KORELLE-P.

THE Korelle-P. is a compact little collapsible camera built to take plates or film packs 4.5 x 6 cm. in size. The construction is similar to that of a press camera, the front panel, with lens and shutter, being supported in the extended position by a strut at each corner. There is no baseboard, so that the lens would normally be exposed even with the camera closed; damage to it is, however, prevented by the provision of a push-on metal cover that encloses the entire lens-shutter assembly.

The size of the camera closed, including this cover and the folded hood of the focussing screen, is $3\frac{1}{2} \times 2\frac{1}{4} \times 1\frac{1}{2}$ in. over all, and the weight is only 14½ ounces. It must, however, be remembered that these dimensions do not include any sensitive material, and so must be compared with some reserve to those of a roll-film camera. The little dark slides, each of which holds a single plate, are approximately $3\frac{1}{2} \times 2\frac{1}{4}$ inches in size, and a set of six makes a pile just one inch thick. Six slides, empty, weigh 7 ounces.

The camera is opened, after removing the protective metal cover, by pulling gently on a pair of finger-grips, one on each side of the shutter. The front then springs forward into position, the four hinged struts locking solid and making the assembly as rigid as a box. The action of opening the camera automatically erects the view-finder, which is of the folding two-lens direct-vision type and gives a large clear image with well-defined boundaries.

The shutter, a delayed-action Compur speeded to 1/250th sec., covers the entire front of the camera. In it is mounted a lens of 7.5 cm. focal length. As the extension of the camera is fixed, focussing is provided by rotation of the front cell of the lens; in the model reviewed, which was fitted with a Schneider Radionar lens of aperture f/3.5, the scale was graduated to 3½ ft. Three red lines between "Inf." and 50 ft. seemed to represent the hyperfocal distances for different stops.

The focussing screen, of fine-grain ground glass, is protected against damage by a folding hood which serves well to exclude light when focussing. If, for the sake of readier access to the corners of the picture, it is preferred to use the screen without protection the hood can be removed by undoing four small screws. While showing the full length of the picture to be taken, the screen is a little narrower than the plate, thus providing a small margin of safety in this direction.

Sharp and Brilliant Image.

Inspection of the image on the screen showed that it was sharp and brilliant, and it is probable that the use of folded bellows in place of the flat-sided ones sometimes used on press-type cameras contributed to this brilliance by eliminating reflected light. Careful check of the focussing scale, and of the setting for "infinity," showed that the camera was accurately adjusted for focus, and a few test-plates exposed in the camera gave extremely sharp little negatives that would enlarge well.

The camera is very well made, and is covered with black leather, except for the front panel, which is enamelled black. A line of nickel round the front edge of the body gives it a very smart appearance. There is a leather carrying-handle into the loops of which a neck-strap could be clipped if desired, and two tripod bushes (English thread, not adapted Continental) are provided.

No Waiting.

Those who like a small and pocketable camera, but who do not care to wait until a number of exposures have been made before they can develop them, will be strongly attracted by the Korelle-P., as each plate exposed can be individually developed. At holiday seasons, when a large number of exposures are likely to be made, recourse can always be had to the film-pack adapter, which can of course be reloaded in daylight with a fresh pack when the full twelve exposures have been made.

The Korelle-P. is available with an f/4.5 Radionar at £7 7s.; with an f/3.5 Radionar at £8 8s.; or with an f/2.9 Enoldar at £9 9s. In each case the price includes three well-made single metal slides and focussing screen. Extra slides cost 5s. per set of three, and a film-pack adapter is obtainable for 5s. 6d. Camera and accessories may be had through any dealer, and for any further details application should be made to the sole agents, Messrs. Photo-Optics Ltd., 32, Lord Street, Liverpool, 2.

Miniature Camera Gossip

By LANCELOT VINING.

I HAVE been surprised at the number of my readers who are urging me to compare the merits of the two American Speed-Flashes made by Messrs. Mendelsohn and Kalart (hereafter for space reasons known as M. and K.) when used with the focal-plane shutter of a miniature camera.

I would much prefer not to, but as I know from the letters received that quite a number of readers are only waiting for my verdict before they order one or other of these outfits, I feel it would be unfair to my readers not to disclose the results of these experiments. I propose to make my comparisons under the heads of adaptability, operation and cost.

Both lamps have been illustrated in these notes, the M. on 17th March and the K. on 6th October, and both were synchronised for the Contax focal-plane shutter by the makers in America; I had nothing to do under that head.

Adaptability.

For this K. gets full marks. It is a real pocket outfit, has only two parts, and is neat, quickly assembled and unobtrusive. The M. has three parts and takes a little longer to erect, but I do not stress this point; its bright metal parts attract quite a little attention and this usually means quite a number of questions.

Operation.

I place M. first under this head. Exposure is made by electric contact, only very slight pressure of the thumb being required; with the K. exposure is made by means of Bowden cable release, which requires quite a strong push. The M. will always be my favourite when I have to photograph a fast-moving subject where the timing will be very delicate or exact.

Both flashes require the same number of movements in operating. With the M. the lamp is at the side of the camera, whilst it is underneath with the K. Experiments when using my Contameter prove the M. to give the better results, as the lamp in the K. is too low.

Cost.

In America the M. costs \$25.00, and the K. \$11.25, and I expect the ratio will be the same over here.

On balance there does not seem to be

ANGELA ANDERES, THE SWISS LADY CHAMPION.
Kalart-Speed Flash, with Philips Lamp. Taken at 15 ft. at 1/1,200th sec.

much in it; in my opinion they are two really good outfits. My work does not allow for failures, but I can truthfully say that I feel I could take either of these outfits out with the utmost confidence.

Late News.

I have just heard that George W. Potts, of 7, Baker Street, London, W.1, has been appointed the wholesale agent in this country for the Kalart Co.

Metol-Meritol.

I am now able to publish this formula, it was only a silly mistake on my part over a telephone message that prevented my doing so before.

Metol—Johnson's	10 grs.
Meritol	60 grs.
Sodium sulphite recryst.	800 grs.
or anhydrous	400 grs.
Water to	10 oz.

Try this as an experiment. I think you will like its action. Develop I.S.S. at 65° Fahr. for 14 minutes, Isopan F (new) for 8 minutes.

Compensating Developer Wanted.

Some time ago a reader complained to me that although he got sharp negatives with Champlin 15 they were all out of focus when he used an Agfa formula. Now Messrs. Agfa will have to think up a developer that compensates for faulty focussing, and we will scrap our range-finders.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

The Miniature at the Docks

By
GEORGE CRICK.

SHIPPING and the water-front offer so much scope for the miniature camera user that it is surprising that more work is not done in these surroundings.

The necessary permits are readily obtained, yet one seldom encounters another photographer at work. I have visited photographic exhibitions in large seaports, and have always found that the subject near at hand is practically neglected.

There is so much to photograph, and a walk along the Dock Estate in any season or weather often yields a crop of interesting pictures. There is generally something new to see—strange craft with their peculiar cargoes, people working at unfamiliar occupations, and sailors

GOING DOWN.

of all nationalities from the huge blonde Germans to the amusing dungaree-clad Lascars.

Why a Miniature?

The miniature camera is particularly suited for this work, which generally calls for depth of focus at fairly large lens apertures. It can be used in all weathers without attracting too much attention or causing obstruction. The direct-vision finder fitted to the miniature is very useful when so many of the pictures have to be "angle shots." With no other instrument can such photographs be so easily taken.

The camera I use takes pictures 4.5×6 cm. in size (16 on $3\frac{1}{2} \times 2\frac{1}{4}$), and is fitted with an $f/3.5$ lens, and I find that it is equal to all demands. A rising front is certainly missed on some occasions, but

FITTING THE HELMET.

the camera can always be pointed boldly upwards or downwards. As the miniature grows in popularity and ousts the larger cameras to some extent, I expect we shall become accustomed to the somewhat distorted effects of these camera tilts.

Lens Hood, Filter, and Meter.

Reflection from the water makes a fairly deep lens hood an indispensable necessity, and it is often possible to increase contrast by the use of a yellow filter. Subjects are generally much brighter than they appear to the eye, so an exposure meter of the photo-electric type should always be carried.

The accompanying photographs of the diver in action were taken with the sun quite low in the sky. The diver was working in forty feet of water, and was caulking a dock gate between a wet and a dry dock, and provide just one example of the kind of subject that can be found along the water-front.

THE AIR SUPPLY.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

PRINTS IN COLOUR.

I have taken some colour positives in a 24×36 mm. camera, using Kodachrome film, and would like to know how to make prints from them. Can it be done? If so, could you recommend me a book on the subject?

K. L. T. (Wokingham.)

To make prints from such films such as Kodachrome it is first necessary to make three negatives through three different colour filters, and then to make three prints, one from each negative, in the correct colours, and finally to super-pose them. We cannot undertake to give you the details of all this in an answer to a query, but would recommend you to apply to the Fountain Press, of 10, Cursitor Street, London, E.C.4, for their list of textbooks, amongst which you will find several dealing with the subject.

HOW TO BEGIN.

I have recently bought a 3×4 cm. camera, and wish to do my own developing and enlarging. But I do not know anything about the subject. Could you suggest a suitable manual, and tell me what apparatus I shall need?

A. J. P. (London.)

We suggest you obtain the Ilford Manual of Photography, published at 2s., and obtainable from any photographic dealer. As for apparatus, you will need a room, preferably with water laid on, that can be made completely dark when required. A tank for developing your films, a measure, an enlarger, three dishes the size of the enlargements you propose to make, and a good dark-room lamp with a safelight for bromide paper (you will not need one for films) should be all you will need in the way of apparatus. Add to this materials—printing paper, developer, and hypo—and you will be completely equipped for developing your first film and turning out your first enlargements.

NOT BIG ENOUGH.

I use a $\frac{1}{2}$ -pl. enlarger for 24×36 mm. negatives, and though I can enlarge the whole to nearly 10×8 , I so often want to enlarge from part only that this is not nearly as much enlargement as I require. If I changed the 4-in. lens on the enlarger for a 6-in. one, should I get a bigger image?

T. J. L. (Birmingham.)

On the contrary, you would get a smaller image at the same extension. Instead of using a longer focus lens you should use one of shorter focus, but of course it must be able to cover the negative from which you enlarge.

COPYING AN ENLARGEMENT.

Some of my negatives have got badly scratched, and I want to make an enlargement of each, touch out the scratches, and rephotograph the finished prints to give me new negatives. On trying this I find the grain of the paper very prominent, and cannot reduce this by making the enlargement big because I have only the No. 2 supplementary lens for the camera (a Leica).

J. L. B. (Alton.)

The grain of the paper shows because the slight roughnesses cast shadows, or are not evenly illuminated at all points. Make your original enlargement on a smooth dead-matt paper which is easy to work upon, and copy it by the most even light you can arrange. As a rule the best is diffused daylight, but if you use artificial light the photograph you are copying must be equally illuminated from two opposite sides.

OVER-DENSE NEGATIVES.

Can you tell me where I have gone wrong in making the enclosed negatives? Exposures were controlled by photo-electric meter, reckoning the speed of the film as 20° Sch., and development was in a proprietary developer, giving the exact time (7 minutes) recommended on the packet at the correct temperature.

H. N. F. (Bristol.)

The films you send us for inspection have been very fully exposed, and are, in our opinion, rather over-developed for miniature negatives. These two factors taken together account for their density. We think, however, that on a suitably soft bromide paper you will not have much difficulty in getting quite good prints. We suggest that when you next develop this particular make of film you reduce your development time from 7 minutes to 4, and you will be quite safe in halving your exposures in future if you so desire. For this, use your meter as usual but reckon the film as having a speed of 23° Sch.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

No. CDVIII.

Mr. H. R.
THORNTON.

"AS I am a comparatively recent addition to the enthusiastic crowd whose absorbing hobby is picture-making, it is not difficult for me to account for my progress from the beginner's stage. Following advice repeatedly given in 'The A.P.' I joined, two years ago, the Small Heath Photographic Society, and with their help and guidance have gradually improved my work. I would suggest that now is the ideal time to join a photographic society, as the winter session is commencing.

"My one and only camera is a sixteen on $2\frac{1}{4} \times 3\frac{1}{4}$ Ikonta, with 7-cm. f/3.5 Tessar, which I use for all subjects, chiefly on account of its lightness and port-

ability. All my accessories, with the exception of a light duralumin tripod, pack into a lantern-slide box—light yellow, green and micro-5 filters, Proxar, Duto soft-focus lens, lens hood, and a useful tape measure.

"With this apparatus I spend my holidays cycling abroad, mainly in the Alps, yet each year I return without a satisfying Alpine landscape picture. Surely landscape work is the hardest of all subjects.

"Many week-ends in the country have made me appreciate the value of early morning light and atmosphere which to me are invaluable for making a picture live.

"I use solely Isopan F film, developed in D76 for five minutes, and I am satisfied if I obtain one negative with exhibition possibilities per spool of sixteen exposures. As I make no record prints the remaining negatives are usually destroyed. The percentage of successes may not be high, but I would prefer to make sixteen prints from one good negative rather than sixteen poor ones from as many mediocre negatives.

"My enlarger is best not described. Suffice it to say that, without the camera used in it, its cost was 17s. 6d.

"Although retouching these small negatives is taboo, in my efforts at picture-making hand shading is nearly always adopted; table salt is mixed with the developer to give juicy blacks when required; and oil pigment *à la* W. L. F. W. is used on the finished print.

"It is still amazing to me that even small parts of these quite small negatives will, if carefully processed, yield 12×10 exhibition prints.

"As a user of Dufaycolor films I make many colour transparencies into lantern slides. The half $2\frac{1}{4} \times 3\frac{1}{4}$ size is very convenient and economical, especially if processing is done at home.

"But possessing only one suitable camera I am often torn between loading a Dufay or an Isopan film. Some day, perhaps, camera makers will fit reverse spooling to all cameras, and thereby enable us to take colour or monochrome negatives at will."

(A further example of Mr. H. R. Thornton's work is reproduced on one of the centre Art pages.)

LACOCK.

H. R. Thornton.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"ODE TO THE SUN," by C. Philip Preston.

THE difficulty of making a satisfactory picture of flowers, even with cut blooms and the facility for arranging them as may be considered desirable, is by no means inappreciable. To make a pleasing composition and at the same time retain the characteristics of the flowers is a task that calls for the exercise of a pretty fair degree of ingenuity, and it is but seldom that anything that could be regarded as an outstanding success is achieved.

How much more difficult it is when growing flowers are under treatment can be imagined, particularly as the power of arrangement is no longer free but subject to the limitation of choice of viewpoint and to whatever slight adjustment that may be feasible through such means as tying the plants or altering their positions by similar measures outside the field of view.

Whether any device of this kind was employed or not in this case is impossible to say. There is no indication in the print of any outside interference, and, taking it as it stands, I think that the arrangement can be regarded as attaining quite a high standard of success. I should have liked to have seen a little more margin above the uppermost of the two flowers, even if it were only half an inch, but there is the possibility that the present trim was imposed by encroachments upon the setting at the top, and, if so, it must be accepted as it is, for the addition, after all, is more a desirability than an essential feature.

However, if it could be attained, the print would be the better for it, and, personally, I would rather dispense with about an inch at the base than lose the extra margin of space at the top, if only on the ground that the revision in the spacing would place the flowers in a stronger position in the picture space.

At present, the left-hand flower is somewhat above the lower of the

four intersections of divisions of thirds and under the upper. The addition at the top and the trim below would bring it nearer to the lower and remove it from so near the horizontal centre line. That, I feel, would provide it with just that touch of strength it needs to accentuate its supremacy over the other; but, in the present rendering, the priority exists

upper right-hand corner. The line, which is indicated in the accompanying sketch, not only does a great deal towards creating a very desirable sense of unity on account of the connection it makes, but also is of moment in that it imparts a diagonal form of arrangement to the composition. It is not a true diagonal because it does not run from corner to corner, but it approximates closely enough to that line to create a similar impression of forcefulness.

At all events, it is strong enough almost to outweigh the slight deficiency in placing I mentioned above, although, from this aspect again, it would become even stronger still with the suggested revision in the spacing.

The chief attraction of the picture, however, rests in its fine expression of an aspect of sunlight—one decided advantage it gains from being taken *in situ*—and its departure from the normal or conventional treatment of flowers as a still-life subject. It is by no means a set piece as most flower studies seem to be, and to its unconventional handling it owes the major portion of its appeal.

Another thing that was favourably commented upon when it was shown at the recent exhibition of the London Salon of Photography was the quality of the print. The richness and depth of tone in the blacks was remarkable, and the purity and gradation

of the lighter tones was no less fine. The range was practically all that a paper could afford, and, like a number of others at the same exhibition, it was on a bromide paper with a glossy or semi-glossy surface.

Its craftsmanship was superb, a fact which, once again, emphasises the need for the highest level of technique in the expression of a pictorial theme, for, no matter how good the latter may be, it cannot be adequately conveyed unless the former is up to the high standard expected nowadays.

"MENTOR."

and the lack of assertiveness is not of major importance.

But, whether by good luck or excellent management, the connection between the flowers is well established. There is a dark-toned leaf on the extreme left leading upwards from that margin towards the leaf in front of the flower. The line is fairly straight and is continued through the lower edge of the next leaf through the upper edge of the one adjoining directly to the second flower, the suggested line being continued to the right-hand side by the leaf in the

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

THAT something in the nature of an attractive subject could have been found in the neighbourhood of No. 1 of the prints reproduced on the opposite page—"Country Cottage," by A. W. Shrubbsall—I do not doubt, but a good deal of it has been missed in this impression, which suffers not a little from the intrusions on each side and a marked lack of gradation in the lighter tones.

Intrusions and Encroachments.

The print is very noticeably deficient in the tone with which the sky is represented. For all practical purposes, there is none at all, and it is difficult to distinguish where the margin ends and the sky begins.

The effect is appreciably exaggerated by the intruding masses of foliage on each side, their darks showing up the lack of tone adjoining, and, in themselves, they convey the idea of a somewhat careless oversight, or that the arrangement of the subject was not given any proper consideration. They hinder, rather than advance, the presentation of the subject, and, had the effect been studied either in the finder or on a focussing screen, it is almost inconceivable that their encroachment would have been permitted.

But the deficiency of tone in the sky has a counterpart in a similar lack of gradation in the values in which the walls of the cottage are shown. There is not a sufficient distinction between the portions in light and those in shadow, a fact which, in itself, could be taken to indicate a measure of under-printing.

Supposing, however, that printing were carried farther and to a degree that would enable the walls to be properly recorded, the darker tones of the hedge, the shadows of the foreground, and the foliage in the distance would all be rendered almost as a solid black.

Alternative Expedients.

Having this in mind, it is evident that printing to a greater depth is not likely to offer any advantage, for, if it removes the disability under which the lights are labouring, it introduces a similar drawback in the rendering of the darks.

We are, therefore, forced to the conclusion that, with the present

paper and the present negative, no better representation is possible, the reason being, of course, that the contrasts of the negative are too great for the range of the printing paper. If, however, a softer grade of paper be employed instead, it would allow the lights to be printed out as far as needful without involving the excess of depth in the darks.

Alternatively, had development of the negative been restricted by something like twenty-five per cent it is probable that, with the same paper, a satisfactory rendering could have been obtained, for, with the lesser degree of development, the contrasts would be correspondingly reduced.

Nevertheless, it is still highly probable that even after one of these adjustments was made, the tone of the sky would not be deep enough—it should be visibly darker than the sunlit portions of the whitewashed walls—and the only method of obtaining such a re-arrangement of the tonal values is by the use of a screen or light filter of a depth appropriate to the character of the negative emulsion.

Screens and Skies.

Were I dealing with a similar sort of subject, I would use a panchromatic plate and a fully correcting filter, for, as far as my knowledge goes, nothing else would do the job as well.

"Pans," however, do not appeal to everybody, but even a comparatively light filter with isochromatic material would offer a better rendering than this. Most plates and films on the market to-day are colour-sensitive to some extent, and fall in this category, so that there is little excuse for the preponderance of blank skies that make their appearance.

Except for No. 7, "At the Gate of the Highlands," by Miss D. Drake, not one of the prints on the opposite page shows an adequate rendering of the tone of the sky, and this scarcely shows up the form of the clouds as it should. Moreover, it is much deeper on the right-hand side than the left, a fault which seems to indicate either an uneven illumination during the printing exposure or uneven development of the negative or print.

It is quite possible, of course, that a sky may, in actual fact, be appreciably

lighter in one portion than another, but where this effect occurs there is almost invariably an indication of a reason for it in the cloud formation or the position of the sun, neither of which exists in the present instance.

Uniformity of Tone.

The same deficiency is repeated in No. 4, "Lake Llanberis," by F. P. Kelly, though here the left-hand side is the darker. The measure of sky tone, however, is so slight that the fault is not of any great moment in comparison with the much greater defect of an absence of a proper degree of tone throughout the sky, but, as far as the landscape portion is concerned, it does show a care in selection that is commendable. This makes it all the more regrettable that good work in one direction should be counteracted by defects in another.

Uneven illumination during printing can be prevented by arranging that the light is centrally placed, is at a sufficient distance from the printing frame, and that no light surfaces are near enough to reflect additional light on any part of the negative.

Reversing the frame half-way through the exposure is another safeguard, but, if very near reflections existed, it could scarcely be expected to be effective.

Dramatic Treatment.

In the light of the preceding remarks, I do not think the remainder of the prints call for any special comment, unless it be that a very different thing would be made of No. 6, "Battersea Power House," by Thomas Winney, if, instead of its blankness in the sky, a forceful and dramatic arrangement of clouds had been incorporated, and, in connection with No. 8, "Goodacre Lake," by P. H. S. Campbell, that the excess of contrast appears to be complicated by an appreciable measure of under-exposure.

On the other hand, No. 5, "Preparing Bait," by Miss B. Hullah, avoids the difficulty of treating the sky by excluding it altogether. This makes it somewhat obscure at first sight, which is a bit of a drawback, but, after it is surmounted, the subject seems well and clearly stated and the device is therefore justified.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

LANTERN LECTURETTES.

IN the first photographic society to which I belonged we were encouraged—compelled would be a truer word—to produce lantern lecturettes, mainly for the purpose of giving the members opportunities of being sarcastic. Some of these little lectures were not bad; others were. I know about the latter sort, because I have still got some of the slides I made, and I cannot understand why I was not assassinated.

More recently the idea has been improved upon. Club members have produced three or four excellent lecturettes which will comfortably fill an evening, and, what is better, arrangements have been made by several groups of societies for the interchange of the lectures. Where personal delivery cannot be managed the lectures are read by members of the borrowing society. I commend this to secretaries who want a good evening.

I am now going to suggest a subject for one of these lecturettes which I think is rather novel in the particular form I have in mind, although I am quite prepared for being told that it is older than the proverbial hills. The topic of the lecturer's town or neighbourhood is not a new one, but I suggest that it be dealt with in the "past and present" manner, which is quite another thing.

The idea was inspired by my examining a small book called "Kentish Appendix," published at Maidstone by J. Smith. The edition I had was dated 1844.

Fig. 1.

Of the few illustrations the first was the view of Maidstone shown in Fig. 1, while Fig. 2 is one of my own versions of the same spot. The church and a few other features are more or less unchanged, but the angler of 1844 would have a thin chance to-day.

This comparison suggests one of the main features of the idea—copies of old prints, pictures and even photographs, shown in conjunction with up-to-date photographs. In some cases there may be little or no change; in others the transformation will be startling.

Take the heading of another page in the "Appendix." It speaks for itself. Railway advertisements in the book tell us that seven of these trains ran from London through Maidstone to Folkestone every day except Sunday, when there were only three; that smoking was strictly prohibited not only on the trains, but in all stations and their precincts; and that all entrances to the stations were closed five minutes before the advertised times of departure of the trains.

It would be a simple matter to compile a series of comparative photographs of modern conditions.

And again with Fig. 4—one of John Larking's original Maidstone and London Fly Vans, "lighted and guarded,"

Fig. 2.

To and from London in 3 Hours!

Fig. 3.

leaving Maidstone at five o'clock in the morning daily, and returning from the City at three o'clock, and from the George and Spur Inns in the Borough at five o'clock.

I do not know much about Maidstone, and have only chosen it because of the "Appendix"; but I wonder if there is any trace of the London shop in Southwark, the proprietors of which advertised in the volume that, owing to the peace with China, the price of tea was reduced to 8s. 2d. a pound. Or does the best circulated paper in Kent still sell 3,000 copies a week? If so, a photograph of its office would surely cause something of a stir.

Well, you have surely got the idea by now—a short lantern lecture on the past and present of your own locality, either as a whole or selecting some definite feature, such as its churches, its industries, its local celebrities. You need not limit your retrospect to 1844, but the farther back you go the more difficult it will be to get suitable comparisons and material.

In any case the preparation of the lecture will take a deal more time than its delivery. Yet the work should be deeply interesting and instructive, not only to yourself but to others. That is, if you treat the subject as it deserves. If you make it as dry and scrappy as these notes you will be wise not to deliver it yourself, and to go into safe hiding whenever someone else does it for you.

A word about the slides themselves. You may have,

or be able to obtain, old negatives from which to make some of the slides, and I know from experience how very interesting these may well prove. Up-to-date versions you will probably have to take specially to suit your particular purpose.

The copying of old woodcuts and similar prints is work of which you may have had no experience, but it is easier than making ordinary photographic slides provided it is

Fig. 4.

done in the proper way. The best plan is to make the negative on a slow lantern plate, or, better still, on a Process plate of the same size.

What is required is a negative with clear gelatine for the lines, and for the white paper a density so great that it will completely stop the light during the exposure for the positive. This also is best made on a slow or Process plate. Hydroquinone or M.Q. are suitable developers, preferably with an extra dose of potassium bromide, and very full development. If in either negative or positive there is slight veiling or fog where there should be clear gelatine it can be cleared by a brief application of Farmer's hypo-ferricyanide reducer. With the proper plate, suitable exposure and development, and an acid fixing bath this should be unnecessary.

W. L. F. W.

The Amateur Photographer and Cinematographer

Annual Lantern-Slide Competition, 1937

Readers are reminded that the latest date for receiving entries is Monday, November 1st, 1937

Classes and Subjects.

- CLASS I.—Landscape, with or without figures, sea subjects and river scenery.
CLASS II.—Portraiture and figure studies, whether indoor or outdoor pictures.
CLASS III.—Architecture, interior and exterior.
CLASS IV.—Flowers, fruit and other "Still-Life" subjects.

- CLASS V.—Natural History Subjects.
CLASS VI.—Lantern slides in colour (not hand-coloured).
CLASS VII.—Champion Class. Open only to those who have won silver or bronze plaques in *The Amateur Photographer and Cinematographer* Lantern-slide Competition.

Conditions and Awards.

(1) All classes are open to amateur and professional photographers without any restriction. All slides must measure $3\frac{1}{2} \times 3\frac{1}{2}$ in., and must be properly spotted for showing in the lantern.

(2) One silver plaque, one bronze plaque, and four certificates are offered in each class except Class VII. In that, the Champion Class, the award will be a mounted and signed exhibition picture by Mr. F. J. Mortimer, the Editor of *The Amateur Photographer and Cinematographer* and *Photograms of the Year*.

(3) All slides which receive any award will become the property of *The Amateur Photographer and Cinematographer*, and will be sent round amongst the societies and such other associations as apply for the loan of them. Any other slides may be selected for circulation in this manner, and will be paid for at the rate of half a crown each.

(4) Competitors may send any number of slides in any class, and may be recorded as winning any number of awards; but no competitor will actually receive in the competition more than one silver plaque, one bronze plaque, and one certificate, on which all his awards will be recorded. Competitors may enter in any number of classes.

(5) Each slide must bear the competitor's name, its title and its class. With the slides must be sent an envelope containing the name and full address of the

competitor, a list of the titles of all the slides he is sending in, and the class in which such are entered. Particulars as to make of plate, exposure, developer used, etc., and other technical data which may be of interest for incorporation in the notes which will accompany the winning slides on their tour among the photographic societies, should also be given where thought necessary.

(6) A stamped and addressed label (not loose stamps) should be sent with the slides for their return if unsuccessful; but in no circumstances can the Editor or the Publisher accept any responsibility for slides sent in for competition, nor for their return; neither can slides be returned which are not accompanied by stamps as above.

(7) Not more than one slide from any one negative can be admitted, nor may any slide compete which has before won an award in these competitions.

(8) The last day for receiving is Monday, November 1st. The slides must be well packed and addressed, "Slide Competition, The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and all carriage charges must be prepaid.

(9) In any case of dispute, the competitor agrees to accept the decision of the Editor of *The Amateur Photographer and Cinematographer* as final.

MAKING BETTER SNAPSHOTS-20

By DAVID CHARLES.

This article is the twentieth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. Against a comparatively light background, passing figures are clearly outlined, although necessarily under-exposed.

Fig. 2. Concentration and determination will ensure a record of at least some of the boldly composed groups that pass at frequent intervals.

LAST week I described a very popular type of subject which could be successfully photographed in spite of exposures being definitely on the "under" side. Here is another, perhaps not so pretty-pretty, but still full of pictorial possibilities.

Taking a rapid glance at the illustrations, I think it will be agreed that even if much fuller exposures had reproduced all the detail in the people's clothing, these results would not gain an iota of effectiveness? In the railway

passing shapes we photograph them.

When first we try our hands at this particular type of subject we have most likely learned enough from previous efforts to decide which shall be the best point of view to give a suitably light background for our silhouetted figures, and at the same time to avoid that broadside view of moving objects which is sure to show at least some blurred detail. The real difficulty arises from the suddenness with which figures seem to come and go in the view-finder. If we stop to consider whether a particular group is effectively "composed" or suitably "placed" in the little frame, that group will most certainly have vanished long before our mind is made up. We may, of course, fire at every group that passes, and with the expenditure of much film hope that one or two results will prove sufficiently good to exhibit as proof of prowess, while burning secretly all the rest.

Making Quick Decisions.

But while there is much to be said for machine-gun photography from the film manufacturer's point of view, there is a surer way to successful pictures. At first it is found that the "time-lag" between seeing the right figures in the right spot and the click of the shutter is long enough to allow the figures to have moved too far forward, as in Fig. 1. But by intently watching, it very soon becomes evident what particular spot on the "background" the principal figure of a group should cover to appear prominent. Then, out of the corner of the eye, one watches for suitable victims; the suitability or otherwise of their outlines is decided upon just a fraction of a second before they arrive

on the predetermined spot. The right ones? Then shoot! If not hold your fire. A much bigger bag of bolder results like Fig. 2 is certain.

Seizing Opportunities.

With a little practice like this from a single point of view one becomes ready to seize upon more chancy effects like Fig. 3, to watch for the instant when the outline looks good, and to make the trigger-finger obey the swift decision. Even in the greyness of a city station, results like these can be got on super-speed film with a lens of the now comparatively moderate aperture of f/4.5.

In more favourable situations than this, and with the aid of a spot of sunlight if possible, excellent semi-silhouette pictures can be made even with a simple box camera. Fig. 4 is an example of the kind of thing I mean; although sadly under-exposed, it remains effective because the silhouetted objects are simple, bold, and outstanding.

Fig. 4. The simplest camera will make this kind of semi-silhouette picture of objects and figures against an open, brightly-lit "background."

station entrance we are aware of figures which suddenly loom up large, and as rapidly disappear. We do not take stock of their garments. They are merely shapes that pass by, and as

Fig. 3. Studying the arrangement of the fixed shapes, and watching for the moving shapes is how this picture was secured.

Equipping the

By ALLON CONWAY.

CAMERAS, like bears, often hibernate during the winter months. The advent of Photoflood bulbs and the large aperture lenses of miniature cameras has now make this unnecessary, and photography is becoming increasingly an all-the-year-round hobby.

If uniformly successful work is to be obtained indoors some equipment has to be devised or purchased. Many, like the writer, will prefer to manufacture their own gadgets, which will have to be transportable and easily dismantled for storage, unless a room is available for a permanent studio.

Lighting Equipment.

The first item to be tackled is lighting. Many a good photograph has been ruined through trying to balance make-shift lamps on tables and chairs. Floor-standards are entirely independent and well worth the extra trouble in manufacture. Brass curtain-rod, either by design or lucky chance, has the advantage that the various sizes slide inside one another and can be made to form quite a satisfactory telescopic stand. The accompanying diagram will explain better than words how these were devised.

It is advisable to make at least two stands, one extending from 4 to 7 ft., and the other with shorter members to cover the range between 3 and 6 ft. If a lower light than this is required use can be made of the fitting at E on the diagram.

Reflectors for Photofloods.

The next question is that of reflectors. After a good many tests with a photo-electric meter, it appears without question advisable to purchase those made from spun aluminium. White cardboard or aluminium paint is quite satisfactory, but much of the light is lost. The writer found that one bulb in a good reflector was equal to three in quite well-made substitutes. There lies the choice between the cone-shaped variety and the bulbous type. The latter give a more concentrated beam of a spotlight type, but need care in arranging or the lighting will be too hard.

DIAGRAM OF LAMP-STANDARD.

- A. Base formed of two 2-ft. pieces of 2 x 1 in. batten halved together at right angles.
- B. Galvanised iron pipe flange obtainable from any plumber.
- C. 6-in. length of galvanised iron pipe threaded to screw into B (this joint enables base to be removed for storage).
- D. Hack-saw cut in brass curtain-rod to enable it to be forced into the G.I. pipe and make a tight fit.
- E. Fitting for lamp at low level. A piece of hardwood bored to fit larger brass rod and slit with a saw, so that it can be pinched with a thumb-screw O.
- F. Dowel of hardwood same diameter as small rod at J glued into E.
- G. Brass curtain-rod about 3 in. diameter.
- H. Thumb-screw with nut soldered on to G to grip I (alternatively a rubber band coiled round I will slip up and down and hold the extended stand).
- I. Smaller brass rod fitting inside G.
- J. Thin brass rod for which a notch is filed in I and the two soldered together firmly.
- K. Piece of 1/2-in. plywood to take batten lamp-holder L and switch S.
- M. Hardwood strip bored to fit J or F with saw cut and fitted with thumb-screw O.

As is generally known, Photoflood bulbs are of the overrun type and their life is short. Lighting cannot be arranged in a minute, and the changing over to ordinary bulbs for focussing is a lengthy procedure and leads to burnt fingers. It is therefore worth while to arrange for series-parallel switching. This is a somewhat fearsome term, but simply means that two bulbs share the current for focussing, and are switched over each to the mains for taking. The preliminary heating up alone is very beneficial, and in this connection it may be interesting to note that the writer has one bulb that has been in regular use for two seasons, and the majority will last at least one winter and take dozens of photographs.

The Control-Box.

A suitable box which can be easily stored away is shown in the photograph, and a wiring diagram is also given. The two pin-plugs at the ends are for ordinary use, and the lamp-holders on the top can be used if a bayonet fitting has to be connected, or for evening-up the circuit if an odd number of bulbs are being used

Home Studio

for an exposure. It must be understood that the same number of lamps must be plugged into each side of the box if it is to function properly. If several plugs are needed at each end a three-way adapter can be obtained for 6d. It may be of interest that a Photoflood bulb passes about 1 ampère, so that two can be connected to a lighting circuit with safety and four to a 5-amp. plug.

A Portable Background.

The remaining problem is that of the background. A simple scheme is to manufacture one out of cheap material tacked to a blind roller, with a lath to hold it taut at the bottom. Such a cloth can be suspended from the picture-rail and put away in a cupboard without creasing. A light grey colour will serve most purposes, and can be made to appear dark or light according to how near the lamps and the subjects are to it.

Some Useful Accessories.

With this suggested equipment, quite useful work can be done. In time, the need of a spotlight for special effects may be felt, but unless very good facilities are available it is better to purchase this ready made. If the lighting should prove too hard, caps can be made for the reflectors out of butter muslin with elastic let into the hem to hold them on. In addition one or two small plywood screens covered with white or silvered paper will help considerably in preventing light loss and stopping stray beams from entering the lens. In this connection, it must be remembered that a really efficient lens hood is essential for artificial-light work.

WIRING DIAGRAM OF SWITCH-BOX.

The box is shown by the dotted lines with the sides opened out. The two single-way tumbler switches SW 1 and 2 are fixed to the two longer sides of the box, and the two 5-amp. two-pin plugs P to the two shorter sides. Two batten lamp-holders L are fixed to the lid, and the bottom is detachable for wiring. The wiring looks a little complicated, but if the diagram is followed carefully it can be carried out in a very few minutes. MM denotes the wires to the mains, which ought to be carried through a fuse-plug to protect the house circuit.

The switch-box of which a wiring diagram is given on the right.

CAMERA-CONSCIOUS.

IT is probable that the majority of failures in novices' efforts at portraiture are attributable to faulty lighting and to poor placing or arrangement of the subject.

Few amateurs have access to expensive spot- and flood-light equipment, and fewer still employ models who will pose for hours on end whilst the earnest photographer experiments with different lighting-effects and settings. There is, however, a branch of photography, popularly known as "table-top" work, which provides ample scope in one's own living-room for experiments in these aspects of portraiture. Besides being a wonderful exercise for improving technique it will while away many a winter's evening in a most absorbing and pleasurable manner.

Everyone who has visited a theatre knows how dark lines and shadows alter expressions considerably, and the failure of the novice's portrait to be a "likeness" can usually be traced to over-accentuated and misplaced shadows. The dolls in the

boredom, and so forth, simply by altering the relative positions of the camera, the light, and the subject, and by varying the set of their hats. The difference of one or two degrees either way in any of these adjustments makes an extraordinary difference, and those who have not yet experimented in this

SMITTEN.

THE RIVALS.

Prelude to Portraiture

By C. P. VAUGHAN.

accompanying illustrations are all of one-piece moulded rubber with features as unalterable as the Sphinx, yet they can be made to portray innumerable expressions such as doubt, egoism,

chin, to express self-satisfaction with the description of the size of the "fish that got away." Using another hat tilted forward slightly, coupled with *contre-jour* lighting which leaves the face in the shadow, diminishes these characteristics and so, with the self-same doll, we get the seaside photo-

A FISHERMAN'S YARN.

grapher's "Wait-for-the-dickie-bird" expression in the picture "The Tin-type Man." Twist him round sideways, again altering the set of his hat, as in "Nobody asked you, sir!" and you have yet another side of his character revealed.

The dubious representatives of Eton and Harrow in "The Rivals" regard each other with ill-con-

line will be astounded at the illimitable possibilities opened to them.

Take the central figure in "A Fisherman's Yarn." The pushed-back hat, revealing the massive forehead and arched eyebrows, helps the accentuated whites of the eyes, and the top lighting on the cheek and drawn-in double-

cealed mutual distaste and suspicion, whilst the lady, having changed her affection as well as her expression, faces the camera in "Camera-Conscious" far more coyly than does her bored swain.

The ordinary living-room lighting arrangements are all that are necessary for these effects. Electricity, of course, is the most adaptable, followed by incandescent oil lamps, with rigid gas-brackets as a poor third, but for the encouragement of those having only the last-named source of illumination, it may be mentioned that all the

THE TIN-TYPE MAN.

accompanying illustrations were taken by the light of one fixed gas burner and one portable light consisting of the swan-necked burner from the enlarger, fed by a long rubber tube.

The portable light was used in

preference to a reflector as it was found that more satisfactory modelling could thus be obtained as well as more luminous shadows. When so used, the secondary light should be at a greater distance from the models than the main light, and it should also be moved slightly from time to time during the exposure to avoid too obvious a double shadow.

Having reached a stage of proficiency in these table-top portraits, real-life home portraiture may be undertaken with full confidence, for the knowledge gained will enable the operator to pose and light his or her subject without the long, patience-trying preliminaries which are so fatal to natural pose and expression.

The many varying factors make it impossible to lay down any definite exposure, but for those who have had no experience in artificial-light photography, a trial exposure of, say, four minutes at $f/8$ will indicate what the correct one should be, bearing in mind that full exposure and light develop-

ment are called for if the best results are to be obtained.

"NOBODY ASKED YOU, SIR!"

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

VIEWING SCREENS.

SIR,—I was interested in your remarks under the heading "Viewing Screens" in "The A.P." of September 29th, where you state that the manufacturers of colour film might turn their attention to something practical and ornamental with the idea of making them a piece of domestic furniture for the dining-room.

It might interest you to know that the front of my house faces N.E. The front door is a solid teak one well set back under a deep porch. In the door an aperture was made so that six quarter-plate transparencies could be arranged and changed at will. Both Finlay and Dufay transparencies faded after two to three months' exposure. The next improvement needed, in my opinion, is to get the colours fast to light.

—Yours, etc.,

F. W. MURRELL.

PLATES.

SIR,—Mr. Zimmerman, in your September 8th issue, expresses his belief that films are inherently unable to produce quite the same crispness of definition given by plates. This was my own opinion, but I have had to modify it after the following test.

I placed a reflex camera on a heavy table and a weight on the reflex to prevent movement. I focussed it on an object which included some printed matter. A sheet of clear glass was put in the book-form dark slide. Since this alters the focus, I focussed finally on a fragment of ground glass held against the clear glass. I then removed the slide and put an Ilford Hyper. Pan. plate (backed) against the glass. Exposure was made on the electric light switch to eliminate all possibility of camera shake. I then removed the plate and put a cut length of Ilford Hyper. Pan. roll film against the clear glass, pressing it firmly against the glass by using another sheet of glass behind it, pressed against the spring. One can fairly say that the roll film was truly flat. Neither the negatives nor the enlargements show the slightest variation in definition, when viewed through a watchmaker's glass.

I would much like to hear from any other experimentally-minded reader willing to repeat this test, which seems to me conclusive.—Yours, etc.,

R. E. DICKINSON.

ECONOMY WITH PHOTOFLOOD LAMPS.

SIR,—I was particularly interested in the article by J. R. S. Leask, on economy in the use of Photoflood lamps, in the issue of "The A.P." dated September 29th.

Your correspondent states that by using a 60-watt lamp as a resistance in series with a set of four Photoflood lamps which are wired in parallel, he is able to operate the lamps at half power whilst arranging and composing his picture.

Whilst the system of wiring which he illustrates is quite sound, I have found by my experiments, that in stating a 60-watt lamp to be a suitable resistance for use with Photoflood lamps, he is quite wrong. He has either made an error in stating his lamp to be 60 watt, or else he has never actually tried the experiment. I have not a very accurate idea of the wattage of a Photoflood lamp, except to say that it is very considerably more than 60, and any electrician would be able to tell Mr. Leask that to make a lamp work at half its power, a resistance must be employed which is of the same current consumption as the lamp in question, and I have found that the surest way of achieving this object is to use another Photoflood lamp in series. If Mr. Leask will wire up a 60-watt lamp in series with a Photoflood lamp, he will find that the Photoflood does not show the slightest suggestion of a glimmer, whilst the resistance lamp will burn at its normal brilliance.

—Yours, etc.,

H. A. MARKWICK.

SUGAR-COATED GASLIGHT PAPER.

SIR,—I was very surprised to see the advice implied by S. W. Jarvis in his article, viz., to control the depth of gaslight prints by snatching them out of the developer directly they appear to be dark enough. I have always understood that the correct depth is governed entirely by length of exposure (although, of course, different developer formulæ will give different results), and that under-development of either gaslight or bromide prints is one of the commonest and most heinous errors made by beginners, leading to certain impoverishment of the tones and general quality. For years I have worked rigidly to the time and temperature recommended by the makers of the respective papers, with about 30 per cent extra time allowed to make sure of getting really juicy blacks.

If Mr. Jarvis thinks that "considerable skill and manual dexterity" are called for in order to take a gaslight print out of an M.Q. developer at the end of 45 seconds or one minute (until which time development is not complete), then he must be somewhat clumsy with his fingers. Or are my methods all wrong?—Yours, etc.,

V. P. WILLIAMS.

Amateur Cinematography

Amateur Documentaries

By
D. CHARLES OTTLEY.

THE significance of the documentary film as one of the most important branches of cinema becomes the more evident with every passing year. Paul Rotha's slogan "film the people," together with his comprehensive treatise upon documentary films as a whole have no doubt had something to do with this. Quite apart, however, there is a growing tendency by a large number of cinema patrons to receive with favour a well-constructed film of the interest-cum-educational type in contrast to and as a relief from the rather overdone fictional releases that emanate from Hollywood. For the amateur the documentary film offers an attractive means of self-expression without the heavy outlay involved when attempting the production of story films. Alike to the ciné society or the lone worker the documentary offers equal opportunities, and the expenditure in footage need not be great if the subject be adequately dramatised in accordance with the best cinematic traditions.

Note carefully the choice of the word "dramatised," because upon the successful dramatisation of a series of commonplace, everyday happenings depends the success or failure of our effort. A documentary film is not merely a collection of shots chosen for their pictorial beauty, nor is it a series of happenings that appeal in the main to our emotional or sensational side. It constitutes rather a logical presentment of something that is, in itself, commonplace.

The film should have its "story content" and a climax should develop as in any film of the photo-play type. The stronger the climax, when such evolves naturally from the subject-matter forming the basis of our reel, the more successful may we regard our efforts. The world abounds with possible subjects for documentary films. The difficulty is rather one of selection. Attaching to the most ordinary things and happenings is the germ from which a worth-while (if not noteworthy) film might evolve. The arrival of the morning paper leads, under logical development, from a doorstep to that miracle of human and mechanical organisation, the newspaper house. The delivery of a pint of milk in the well-known glass bottle offers at least a threefold development:—

(a) The story of the milkman (human documentary); (b) the story of the cow (animal documentary); (c) the story of the sealing disc of cardboard (mechanical documentary).

The clothes we wear, the things we

eat, our occupations, hobbies, our places of call, even the polish we put on our shoes, each might beget more than one reel of entrancing entertainment if treated cinematically and developed upon documentary lines.

The story of a postage stamp might tell of a gigantic government department or lead us through the wards of some fever hospital via the child who licked its gummed back. "Wanted for Murder" might begin with a close-up of a policeman's helmet and end with a micro-slide showing the germ-carrying propensities of the common house-fly. "Chalk"—this single word could take us from a pavement artist on the Embankment to the peaceful seclusion of Newington Institution, where, under the wing of London's vast Public Assistance Scheme, the homeless find shelter, clothing, food, light, warmth and music. Down to the sea the same word could take us, to cliffs that look as though they are hewn from a mighty snow-drift—or to the caves whose walls still bear testimony of a primitive race. Or, again, from a box containing one hundred and forty-four sticks, one could emerge, and writing upon a blackboard,

tell the story of an educational system barred to none.

Possibly a case-paper (any one of half a million stored in the vaults of County Hall) offers as good a subject as any for documentary treatment. Stranger than fiction are the facts contained within these buff folders. Such a film (like Grierson's exquisite "Song of Ceylon") should be divided into three parts, thus: Part 1, the "A" sheet; Part 2, the "B" sheet; Part 3, the "C" sheet.

The climax to such a film could be twofold (a) the hand of a clerk inserting the single word "dead," meaning at once so much and yet so little, and (b) the final consumption by fire, "twenty years after."

One supposes that the first essential of a worth-while documentary film is to visualise facts. Entertainment value would normally be a secondary consideration. But such are the possibilities of cinema, and its art, that fact and fancy can be so closely intermixed as to deceive the eye; and it is in this deception (but under no circumstances distortion) that the art of the documentary film lies.

The Hunting season will afford endless opportunities for good action subjects, both in black-and-white and colour. The story of the hunt can be made into an excellent documentary. Several points mentioned in the article "Following the Hounds with a Camera" elsewhere in this issue can be applied by the cinematographer.

Colour Psychology

ALTHOUGH late in the season, colour for the 9.5-mm. worker has come at last. Next year one supposes a large percentage of films produced will make use of the Dufay-Chromex system despite the fact that 21s. will only provide for less than two minutes' animation in actual screen time. This charge, however, includes processing to direct positive which, with many normal brands of film, is an "extra" sometimes overlooked until the bill arrives; referring of course to those who do not do their own developing.

Choice of Subject.

With such an increase in expenditure it is well to consider carefully just which subjects depend for satisfactory cinematic interpretation upon a rendition in colour. One is inclined to exclude drama, first, because monochrome intelligently employed is in itself a tremendous stimulus to the "conception dramatic" and, secondly, because indoor sets, or rather, indoor sets such as the amateur is likely to employ, hardly offer scope sufficient to justify the use of a natural colour emulsion.

In documentaries, travel films, and scenics will be found the real call for colour work, and such reels, if begun in colour, should retain its use throughout. Little justification, other than a lean pocket, can urge the inclusion of some sequences in colour and others in monochrome. The one medium or the other should be decided upon and the decision adhered to.

The all-colour film, if it is to distinguish or even justify itself in the artistic as well as the cinematic sense, will impose an added responsibility upon the part of the cameraman. In addition to its pictorial content each shot must be considered with regard to its colour-content. The indiscriminate piecing together of colour takes is likely to result in something closely resembling an animated patch-work quilt. For the first time the worker's concern will not be, "What will this scene look like transferred into monochrome?" but rather, "How will this scene, the rendition of which I know because my film is reproducing approximately what I see, balance with the preceding and succeeding shots?" In other words, a colour as well as a cinematic continuity enters into the scheme of things and, while still functioning as a recording agent, the photographic aspect is no longer available for monochromatic intensification in the dramatic sense.

The Film as a Whole.

Unlike a book with a frontispiece in colour and sundry plates in black-and-white, the colour film should be looked upon as a canvas complete in itself and *matched* as regards colour harmonies. Each change of scene, each variation in angle or viewpoint, may be likened to an analysis of a portion of that canvas, the whole meanwhile being borne in mind and its common characteristics under no circumstances altered.

Much colour work that has come from

the professionals has been elementary if viewed from the aesthetic standpoint. One-subject reels such as the Coronation Procession, the Naval Review and Trooping the Colour make little claim upon the artistic capabilities of cameraman or cutter. Being one-subject reels, a single theme, of a more or less constant colour characteristic, is picked up and followed, the only variations being those of shooting-angle and viewpoint. More ambitious efforts, particularly in the department of drama, bear obvious traces of hasty indecision regarding the schematic development of colour continuity. Except to the trained eye this does not matter very much, nor does one suppose the "fan fraternity" experiences that sickly sensation known to the connoisseur of pigments caused when the fundamentals of colour blending are ignored.

Reproduction, not Distortion.

A wholly satisfying natural colour film has yet to be made, but there is little doubt that it will come when more experience has been gained in a department of cinematic art that takes from the camera one of its favourite habits, that of distorting Nature, and substitutes a rather more difficult one, that of reproducing her just as she is.

And in this connection there is no reason why the amateur should not compete with his professional brother in the realisation of an ideal latent in the minds of all cinematographers from the early days.

D. O.

Exhibitions and Competitions

CURRENT AND FUTURE.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

"Daily Mirror" Weekly Photographic Competition, "Queerios." Cash prizes. (The Editor, "Daily Mirror," Fetter Lane, London, E.C.4.)

XVIIe Salon International de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Beelaere, Boitsfort, Brussels.)

I International Exhibition of the Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Yugoslavia.)

The Victorian International Salon.—Open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Open, October. (Modern Magyar Fényképezok, VIII, Rákóczi-ut, 19, Budapest, Hungary.)

Windesham Camera Club.—Open, October 21–23. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Folkestone C.C. Exhibition of Photography.—Open, October 23–December 4. (A. J. Stewart, 25, Guildhall Street, Folkestone.)

Fourth Canadian International Salon of Photographic Art.—Open, October 23–November 15. (Ex-

hibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Sixth Irish Salon of Photography.—Open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

Cyclists' Touring Club (Metropolitan D.A.) Second Annual Photographic Competition.—Open, October 28–30. (G. H. Craddock, 9, Lady Margaret Road, Kentish Town, N.W.5.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

G.E.C. (Coventry) P.S. 4th Annual Exhibition.—Open, November 8–13. (C. W. Crowe, G.E.C. (Coventry) Photographic Society, General Electric Co. Ltd., Coventry.)

Bournemouth C.C. Open Exhibition of Pictorial Photography.—Open, October 25–30. (John Reid, Westminster Hall, Beacon Road, Bournemouth.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January

(Aszmann Ferenc, Ferenc Josef ut 27, Debrecen Hungary.)

XIe International Fotosalon "Iris."—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Brederodestr, 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31, 1938; open, March 7–12, 1938. (D. H. Cole, 11, Woodlands Road, Ilford, Essex.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April, 1938. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

The Kinematograph Section of the Royal Photographic Society is holding an Exhibition of Kinematography, comprised of films, stills and apparatus, at 35, Russell Square, W.C.1, from November 13th to November 27th. The theme of the exhibition will be "The Film as a Social Force," during the course of which lectures and demonstrations will be delivered. A com-

petition has also been arranged, the rules of which are printed on the entry forms. These are available from the Secretary at the above address.

This winter again the Film Library of the Scottish Travel Association is at the disposal of amateurs, free of charge. The films are all 16-mm. silent, and now include several reels in full colour

(Kodachrome). On application to the Association at 2, North Charlotte Street, Edinburgh, 2, a complete list of the films may be had giving full details of length and subject.

The Association is also prepared to lend collections of lantern slides, showing Scottish scenes, each set being accompanied by notes to form the basis of a lecture.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, October 20th.

Birkenhead P.A. Ten-Minute Lecturettes by Members.
Birmingham P.S. Visit from Stoke-on-Trent Amateur Ciné Society.
Borough Poly. P.S. "Architecture and Sunshine." E. R. Bull.
Brighton and Hove C.C. "Sea Land Seen Again." H. G. Dannatt.
Croydon C.C. "Nilgiri Glory." A. Coleman.
Dennistoun C.C. "Composition." J. Roberts.
Edinburgh P.S. "Elementary Dark-room Technique." H. D. Wylie.
Handsworth P.S. "Printing and Enlarging." J. T. Suffield.
Hinckley and D.P.S. "Ways and Means of Bird Photography." H. G. Wagstaff.
Ilford P.S. Visit to South Essex C.C. "Science and Photography."
Leominster P.S. "Northern Italy." P. G. Hopcroft.
Mountain Ash C.C. Demonstration. "Platinotype Printing." Mr. James.
Northallerton and D.P. and C.S. "The Enlarger Problem." R. P. Haw.
Shropshire C.C. "Choosing a Camera." J. H. Gornall.
Solihull P.S. "Pictorial Composition." J. A. Foister.
South Essex C.C. "Science and Photography."
S. Suburban and Catford P.S. "Retouching." W. Bell.
Streatham P.S. "Holidays in Germany and Austria." P. B. Dannatt.
Worcestershire C.C. "A.P." Prize Slides (1936).
York P.S. Y.P.U. Pictorial Trophy Prints.

Thursday, October 21st.

Amateur Cinematographers' Association. "Making a Club Film."
Armsley and Wortley P.S. "The Fascination of Colour Photography." W. Morris.
Ashton-under-Lyne P.S. Members' Slide Night.
Bayswater and Paddington P.S. "The Lights of London." G. A. Slight.
Blyth and D.C.C. Demonstration of Negative Development.
Bolton C.C. Demonstration. After-Treatment of the Negative.
Bury P.S. Print Folio.
Camberwell C.C. "Super-Imposing." G. A. Slight.
Gateshead and D.C.C. Lantern-Slide Making. W. J. Brown.
Greenock C.C. "Enlarging." W. N. Henderson.
Hall Green P.S. "Preparation of a Print for Exhibition." F. W. Green.
Hampshire House P.S. Portfolios. H. A. Murch.
Herefordshire P.S. "Finishing Work on Enlargements." Captain F. L. Hope.
Hull P.S. Portraiture Evening—Practical Work. R. E. Booth.
Isle of Wight C.C. Fine-Grain Development.
Keighley and D.P.A. "Southern France, the Land of Sunshine." W. E. Gundill.
Liverpool A.P.A. "Pictures of the Orient." H. H. Belhouse.
Loughborough P.S. "Church, Craftsmen and Camera." Dr. E. L. Ashby.
Medway A.P.A. "Hadrian's Wall." Geoffrey E. Peachey.
Northamptonshire N.H.S. and F.C. "Famous old Inns of England."
Oldham P.S. Bromoil—Demonstration. F. W. Taylor.
Partick C.C. S.P.F. Portfolio.
Rochdale P.S. "Retouching."
Runcorn C.C. "The Continent with Car and Camera." J. C. O. Dickson.
Wakefield and D.C.C. "From Boulogne to San Sebastian." Capt. R. Ede England.
Welfare C.C. "Colour Filters." Ilford Ltd.
Windlesham C.C. Hon. Anthony Asquith opens Exhibition.
Wimbledon C.C. "True Pictorialism" Portfolio. F. C. Tilney.
Woolwich P.S. "Combination Enlarging." W. E. Ginger.
Yeovil P.S. A Lecture on Composition. S. Bridgen.

Friday, October 22nd.

Royal Photographic Society. Films by Polytechnic Students.
Dartmouth L. and D.S.P.S. Enlarging Evening for Beginners.
Harrogate P.S. "A Medley of Lantern Slides." C. A. Brotherton.
King's Heath and D.P.S. Members' Lantern Slide Night.
Southend-on-Sea and D.P.S. "Photography in Commerce and Industry."
Thurrock P.S. Portraiture.
Windlesham C.C. "Pictorial Essentials." R. H. Lawton.

Saturday, October 23rd.

Hampshire House P.S. Criticism of Members' Monthly Competition.
Northamptonshire N.H.S. and F.C. Autumn Ramble to Harlestone Heath.
Windlesham C.C. Members' Debate on Exhibition led by K. Dannatt.

Monday, October 25th.

Bexley Heath P.S. The Bromley Quartette—Lecturettes.
Blackburn and D.C.C. "Portrait Lighting." M. Piddington.
Blackpool and Fylde P.S. "Lantern Slides." L. Payne.
Bournemouth C.C. Opening of Annual Exhibition.
Bradford P.S. "Methods of Development." E. B. Johnson.
Brighton and Hove C.C. Instruction Night No. 1—Portraiture.

Monday, October 25th (contd.).

Erdington and D.P.S. "Development of Miniature Films." N. R. Trout.
Hornchurch Evening Inst. P.S. Talk with Examples on Various Papers.
Kidderminster and D.P.S. "A Criticism of Members' Prints." S. Bridgen.
Kingston C.C. "Some of the Uses to which our Native Timber has been put."
Lancaster P.S. "Reconstruction." Messrs. C. Thomas and H. Firth.
Leeds C.C. Work Night.
Leek P.S. 1936 Alliance Prints.
Liverpool A.P.A. "The Manufacture of Photographic Lenses."
Newcastle (Staffs) and D.C.C. Monthly Competition—Slides.
Oxford P.S. Exhibitions and Competition.
Shropshire P.S. "A Ciné Camera in Three Continents." Dr. G. W. Morey.
Southampton C.C. "In Search of Sunshine." F. G. Newmarch.
Southport P.S. Lecturette Night.
Stourbridge Inst. P.S. Competition—Open Landscape.
Walsall P.S. "To Venice and Back by Alpine Passes." A. Hackett.
Walthamstow and D.P.S. "Exploring Greater London." T. D. Nun.

Tuesday, October 26th.

Royal Photographic Society. "Scientific and Technical Photography."
Beckenham P.S. Print and Slide Competition.
Belfast C.P.A. C.C. Demonstration of Bromide Enlarging.
Birmingham P.S. "Panchromatism." W. E. Webb.
Blackpool and Fylde P.S. "The Coasts of France and Italy." Rev. H. O. Fenton.
Bridge of Allan and D.P.S. Holiday Reminiscences by Members.
Cambridge P.C. Ciné Evening. R. S. Beck.
Eastbourne C. and Ciné C. "Colour in the Old Cities and Mountains of Germany."
Exeter C.C. Nippon C.C. Portfolio. Photographic Alliance.
Hackney P.S. "Bromoil." A. B. Richardson.
Halifax P.S. "Mounting and Lettering." W. H. Wilkinson.
Harrow C.C. "The Treatment of Negatives." H. A. Hayes.
Leeds P.S. "The Bromoil Process." W. E. Gundill.
Leicester and Leicestershire P.S. "Enlarging on Chloro-Bromide Papers."
Leith C.C. "Enlarging."
Leominster P.S. "Chat on Pictorial Photography—Landscape." S. Bridgen.
Manchester A.P.S. An Evening with Manchester Film Society.
Nelson C.C. "25 Years of Bird Photography." R. Woods.
Newcastle and Tyneside P.S. Print Competition Criticism.
Newport (Mon.) C.C. "The A.P." Prize Slides, 1936.
Oldham P.S. Council Meeting.
Peterborough P.S. Photographic Alliance Competition Slides.
Portsmouth C.C. Film Show. R. W. S. Parriss.
Preston Scientific Society. Whist Drive.
Rugby P.S. "Lecturettes."
Sheffield P.S. "Picture-Making with Enlarging Apparatus."
Small Heath P.S. Competition—"Landscape."
South Shields P.S. Analytical Criticism. H. E. Galloway.
Stafford P.S. Competition (Prints and Slides).
St. Bride P.S. Competition. Club Night.
Warrington P.S. "Panchromatism."
Wilkesden P.S. "Some Pictorial Views." E. C. Butcher.
Wolverhampton P.S. "Beautiful Manxland." H. Browning Button.
Worthing C.C. September Outing Prints Competition.

Wednesday, October 27th.

Birkenhead P.A. "History of the B.P.A." T. J. Smith.
Birmingham P.S. Open Night for Projection and Discussion of Members' Films.
Borough Poly. P.S. "Chemistry of Photography." J. Stacey.
Brighton and Hove C.C. "St. Albans." F. J. Jones.
Croydon C.C. Discussion on Prints and Slides. E. J. Wadham and D. S. Rose.
Dennistoun C.C. Enlarging Demonstration.
Handsworth P.S. "Print Finishing." R. Sanders.
Hinckley and D.P.S. "The Road to Baghdad." R. Gorbald.
Ilford P.S. "Developing Roll Film." S. K. Tweedy.
Mountain Ash C.C. "The Country's Sweet Simplicity." Competition.
Northallerton and D.P. and C.S. "Miniature or Non-Miniature."
Partick C.C. "My Technique of Tank Development." J. C. Balden.
Pontefract P.S. "Bromide Enlarging and Masking Prints with an Autofix."
Rochdale P.S. L. and C.P.U. 1937 Print Portfolio.
South Essex C.C. Print Criticism.
S. Suburban and Catford P.S. "The Norfolk Broads in Colour." A. E. Dadson.
Worcestershire C.C. Whist Drive.
York P.S. "Architectural Photography." H. W. Bennett.

Any amateurs in Bradford who are desirous of joining a Photographic Society will be welcomed by the Bradford Junior Photographic Club, which meets on Tuesday evenings at the Queen's Hotel, Bridge Street. Intending members should write to the Hon. Secretary, Mrs. J. Bruce, 5, Harden Grove, Eccleshill.

"The Year's Photography," the annual issued by the Royal Photographic Society, is again to hand, and, as in previous years, is an excellent volume of reproductions of some of the outstanding exhibits in the Society's Annual Exhibition. All the different sections, including technical, natural history and lantern slides, are illustrated, and articles by Bertram Cox, J. Dudley Johnston,

Hugh G. Wagstaff, and Edmund A. Robins provide a commentary on the reproductions. The price of the book is 2s. 6d. net, and is obtainable from all booksellers or from the Secretary, the R.P.S., 35, Russell Square, W.C.

A new photographic society, known as the Woodthorn Photographic Club, has been formed in the Clapham district. Full particulars of this club may be obtained from the Secretary, Mr. J. H. Coghlan, 139, Albert Palace Mansions, Battersea Park, S.W.11.

The Annual Exhibition of the South London Photographic Society will be held in the South London Art Gallery, Peckham Road, S.E.15, from February

19th to March 19th, 1938, the entries for which close on 31st January. There are three classes: (1) Prints (any subject), (2) Lantern Slides (monochrome), (3) Colour Slides. The entry fee is 1s. per print, or per set of four slides. Silver medals, bronze medals and certificates will be awarded. The entry forms and detailed particulars are obtainable from the Hon. Exhibition Secretary, Mr. H. S. Adams, 40, Stockwell Park Road, S.W.9.

A Photographic Society has been formed in the Grays district, under the Secretaryship of Mr. A. W. Thwaites, Church View, London Road, West Thurrock, Grays, to whom application for information regarding the Society should be addressed.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

"The Red Book," the annual of the Photographic Alliance for 1937-38, has just been issued. The little volume follows the form already well established, and again is filled with a mass of information of value to the members of the societies forming the Alliance. This now includes, in addition to the parent Society—the R.P.S., the Northern Counties, the Midland Counties and the Western Counties Photographic Federations, the Yorkshire and the Lancashire and Cheshire Photographic Unions, the East Anglian Federation, the Federation of Ciné Societies and the Central Association of Photographic Societies. "The Red Book" contains particulars of all the societies in these organisations, and a number of foreign societies. Several short practical articles are also included, notes regarding permits to photograph, and a section is devoted to formulae. Copies are issued to members of the societies.

The Australian Commemorative Salon of Photography, Sydney, included in the Official Programme of Australia's 150th Anniversary Celebrations, will be held at the Commonwealth Bank Buildings during April, 1938. Entries should reach the Hon. Exhibition Secretary, Mr. H. V. Leckie, Box 829G, G.P.O., Sydney, New South Wales, not later than the 25th February, 1938. There are six sections, which include Historical and Technical subjects as well as Pictorial and Commercial prints. In each of these sections three silver medals will be at the disposal of the judges. The entry fee of 5s. covers four prints or eight transparencies. We have a limited number of schedules for distribution at this office, or they may be obtained direct from the Hon. Exhibition Secretary at the address given above.

We learn that amateur photographers in Argentina have banded together to form a photographic club, of which we have received a sample entry form. Their secretary, Mr. A. S. Challis, Calle Florida 32, Buenos Aires, informs us that the members are all keen readers of "The A.P.," which publication has a large circulation among amateur photographers in Argentina. At present the club meets once a month, but excursions and outings to various places of interest are arranged and the photographic products compared at the monthly meetings.

A membership of over 100, with thirty-three new members during the past twelve months, was a pleasing feature of the Annual Report of The Bournemouth Camera Club. Amateur photographers in Bournemouth who are not members of a photographic society should write to the Hon. Secretary, Mr. J. H. Reid, The Gervis Restaurant, Bournemouth, Hants.

The Amateur Cinema League, Inc., of 420, Lexington Avenue, New York, N.Y., U.S.A., has recently published an interesting 32-page booklet entitled "Film Plans and Scripts," by James W. Moore. It presents a discussion of family filming plans and gives two stories in scenario form ready for production. Like other publications of the League, this booklet is not available except to members. To them it is free, without other charge than the annual membership fee of five dollars. Readers who would like to take advantage of the facilities offered by the Amateur Cinema League should communicate with the Secretary at the above address, enclosing an International Reply Coupon.

The Clapton Miniature Camera Club has elected Mr. Stewart, of 7, Alcester Crescent, Upper Clapton, E.5, Secretary in place of Mr. Heaverman. The Committee of the Club has also decided to deal with the numerous applications for membership of other than miniature workers by forming a section of "Larger than Miniature" members. The winter syllabus is now ready, and in addition to theoretical talks a series of practical demonstrations will be given during the session. Further particulars are obtainable from the Secretary at the above address.

The Secretary of the Worthing Camera Club, Mr. L. Douthwaite, of 41, St. Lawrence Avenue, Worthing, will be pleased to hear from any amateur photographers in the district who would like further information regarding the club.

The return to "winter time" brings with it an increased demand for indoor entertainment, and amateur cinematographers will be well advised to write to G.B. Equipments, Film House, Wardour Street, W.1, for lists of their new films. The G.B.E. Library Catalogue of over 100 pages contains a list of up-to-date films from which to select many hours of happy entertainment or instruction. This is obtainable either direct or through a dealer, price 1s. We have also received a copy of the Third Edition of Gebescope 16-mm. Sound on Film Library List of Titles, which contains a large list of film titles to suit every occasion, and also gives full information regarding conditions of hire and a Library Membership Application Form. Any who are interested in this particular phase of cinematography should apply to The Librarian, G.B. Equipments, Ltd., at the address given above.

"My Typist," is the title of the latest prizewinning print in the Wallace Heaton Novelty Competition. This print is by Elizabeth Hargreaves, 2, Carlingford Road, London, N.W.3, to whom the weekly award of 21s. has been made. Full particulars regarding these competitions for readers of "The A.P." will be found each week in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue.

The series from No. 1 to 61 included all standard chemical and optical formulae and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulae issued by the leading manufacturers of plates, films and papers.

These facts and formulae are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ x 3½ x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulae." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

97. Makers' Formulæ: Developers for Ilford Papers—(3)

ID-25. Clorona Warm-Tone M.Q.

Metol	10 grs. (0.8 grm.)
Sodium sulphite (anhydrous)	110 grs. (12.5 grm.)
Hydroquinone	30 grs. (3 grm.)
Sodium carbonate (anhydrous)	80 grs. (9 grm.)
Potassium bromide	30 grs. (3 grm.)
Water up to	20 oz. (1,000 c.c.)

If crystallised sulphite or carbonate is used, take 220 grs. (25 grm.) of each.

This developer gives warm-black tones on Clorona in about 1½ minutes. Slightly warmer tones are obtained by increasing exposure and adding extra bromide. For still warmer tones, formula ID-23 is to be preferred.

ID-24. Clorona Warm-Tone Developer.

Chlorquinol or Aduril	60 grs. (6.8 grm.)
Hydroquinone	60 grs. (6.8 grm.)

Sodium sulphite (anhydrous) 550 grs. (62.5 grm.)

Sodium carbonate (anhydrous) 410 grs. (46.5 grm.)

Potassium bromide 6 grs. (0.7 grm.)

Water up to 20 oz. (1,000 c.c.)

If crystallised carbonate and sulphite are used, take 1,100 grs. (125 grm.) of each.

This developer gives a full range of colours from warm-black to red. Coldest tones are obtained by 1½ minutes' development with the undiluted solution; for red tones increase exposure 7 times, dilute the developer 30 times, add 12 grs. (0.6 grm.) of potassium bromide to each 1 oz. (25 c.c.) of stock developer, and develop for 20 minutes. For intermediate tones, give smaller increase in exposure, use the developer less diluted, and add less bromide than for red tones.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Focal Length and Exposure.

Am I right in thinking that a lens of short focal length requires less exposure time than a long-focus lens at the same aperture? If so, can you inform me how the length of exposure varies with the focal length of the lens?

R. H. (Lancashire.)

For all practical purposes exposures are the same for lenses at the same *f*/number whatever their focal length. The only consideration that may arise is that a wide-angle lens of short focus may include near foreground which is dark or has heavy shadows. This foreground may be missed altogether by the longer focus lens. But even in cases such as this the difference made is a very slight one, and bears, as you can see, no necessary relationship to the focal length as such.

Reflection from Lens Mount.

I enclose a negative which has a very distinct ring in the centre of it. It was developed by a D. & P. firm, but the other negatives on the roll do not show this defect.

P. T. (London.)

The probability is that the mark on your negative was caused by direct sunlight on the inner side of the lens mount. That it did not appear on the remaining negatives on the strip is attributable to your not having taken them against the light. Your lens mount should be reblacked, and we should recommend you to use a lens-hood in future for all such subjects as this.

Mottled Prints.

Can you explain the mottled appearance of the enclosed gaslight prints? It often occurs when printing from under-exposed negatives, even though the negatives in question give unmounted prints on P.O.P.

C. E. M. (Manchester.)

Judging from the appearance of your print, and assuming that the marks are not on the negative, we should say that the result is entirely due to uneven development. You must take care that

the developer covers the whole surface of the print at once, and that it is kept gently moving during the development period. If, as is possible, you are not reducing your exposures as much as the thinness of the under-exposed negatives requires, and are rushing the prints into the fixer to prevent them from getting too dark, you have conditions in which uneven development is much more likely to occur than when developing the more correctly-exposed prints from fully-exposed negatives.

Developing $3\frac{1}{2} \times 2\frac{1}{4}$ Films.

I have just bought a tank for $3\frac{1}{2} \times 2\frac{1}{4}$ films, and am in doubt as to what developer to choose. I understand the question of grain is very important, as I shall certainly want to make enlargements. Should I use a fine-grain developer such as Sease III, or are these not suitable for any but miniature films? W. R. B. (Aberdeen.)

The special fine-grain developers such as Sease III are not in the least necessary for $3\frac{1}{2} \times 2\frac{1}{4}$ films, but the semi-fine-grain developers, such as the well-known D.76 formula, should in our opinion be used, and we would recommend you to use either this developer or an M.Q.-borax formula made up by yourself. Unlike the true fine-grain developer, M.Q. borax demands no extra exposure, and by using it you will have the satisfaction of knowing that, if all else is right, you will be able to make quite large prints from comparatively small portions of a negative.

Cross Front.

Cameras are sometimes described as having a "cross front," which I believe means that the front will slide sideways. The use of a rising front has often been discussed in "The A.P.," but I cannot see the use of a cross front.

A. A. (Wolverhampton.)

A cross front is fitted to cameras that have to be turned on their side for horizontal pictures, in which position it becomes a rising front, and is used

for the same purposes. A cross front, as such, is so nearly valueless a movement that it is not fitted to cameras which, through having a reversing back, are used the same way up for both vertical and horizontal pictures.

Spots on Film.

Can you tell me the cause of the spots on the enclosed negatives? They appear to be on the reverse (celluloid) side of the film, and although there are quite a number of these spots on the roll from which the enclosed negative was taken, another film (of different make) developed at the same time is completely free from them.

C. S. (Gateshead-on-Tyne.)

We think the spots to which you refer will show less than you expect in an enlargement, particularly if the enlarger uses a diffuser and not a condenser.

So far as we can see, the spots appear either to have been caused by pressure upon the back of the film, or to be faults in the celluloid itself, and in view of the latter possibility we suggest that you refer the matter to the makers of the film.

Actinometer Meter.

Recently I went to buy some fresh sensitive paper for an actinometer-type exposure meter, and was told that meters of this sort were designed for ordinary non-colour-sensitive plates, and were completely unsuitable for modern panchromatic films. Is this true, please? S. B. (Smethwick.)

To the extent that while the film is sensitive to light of all colours, the paper is sensitive to blue light only, the statement is true. But so long as you use the meter by normal daylight of approximately constant colour, the measurement of the intensity of the blue light made by the meter will serve very well as a measurement of the total intensity of light of all colours. The meter will therefore indicate accurate exposures. But if you try to use it in a very yellow light, artificial or otherwise, the deficiency of blue will slow the response of the paper far more than that of the film, and the meter will indicate much too long an exposure. It is to compensate for this sort of error that panchromatic films are often allotted two different speed-numbers, one for daylight and a second much higher figure for artificial (yellow) light.

An Artist's Camera.

I am an artist and require a camera to help in painting children, still-life, and general purposes. To be useful the pictures must be very sharp and full of detail, and not too small. Exposures will mostly be made indoors. Would a $\frac{1}{4}$ -pl. reflex camera, which I could buy for about £10, be suitable?

R. L. (London.)

The objection to a quarter-plate reflex camera is that the focal-plane shutter is by no means ideal for giving the comparatively long exposures you would require in some cases. As it seems probable that all the work you need can be done in a leisurely manner we think you might try a quarter-plate hand or stand camera, so that you could take advantage of the focussing screen to secure the necessary arrangement and definition. A camera of this sort, with a sufficiently good lens and shutter, should be obtainable for about half the price you name.

BRIGHTER PHOTOGRAPHY

By DAVID CHARLES, F.R.P.S.

PRICE

2/6 net

By post 2/9

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint.

JUST PUBLISHED

THE COMPLETE 9.5mm. CINEMATOPHOTOGRAPHER

By Harold B. Abbott

CLOTH BOARDS
Size 7½" x 5", 260 pages

PRICE 5/- net
By post 5/4

From all leading Booksellers, or
direct from the Publishers

Because of advances in film technique this book supersedes the author's former successful book "Motion Pictures." The beginner can take it up and find everything he needs to know in order to make successful pictures.

How to choose a 9.5-mm. ciné camera ; how to expose correctly ; what to take and how to take it ; full instructions on developing and printing ; methods of planning ; editing, titling and trick effects ; the art of projection ; methods of operation, screen and picture sizes ; giving an efficient show ; all these are explained in detail.

There are nearly 100 illustrations. The book, packed with useful information, is a comprehensive course of instruction in amateur cinematography.

ILIFFE & SONS LTD., DORSET HOUSE, STAMFORD STREET, LONDON, S.E.1

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS in these columns is:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 25 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

Notes being untraceable if lost in transit should not be sent as remittances.

& Co.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

THE REX ELECTRIC EXPOSURE METER

The REX Electric Exposure Meter represents the highest achievement yet attained in the scientific measurement of light values for photographic purposes and is, without doubt, the most sensitive meter available. This super sensitivity is obtained by employing a large size photo-electric selenium cell which is built into the lower portion of the meter body and thus eliminates top light and is fully protected when the instrument is not in use. Unlike other meters, therefore, it is unnecessary to shield the cell during very intense light conditions.

Consider the following points and ask for a demonstration of this amazing meter:—

- ★ Extreme light sensitivity under ANY conditions without the use of any auxiliary attachment.
- ★ The calibrated scale covers the widest possible range. From 13° to 31° Scheiner, for lens apertures from f/1.4 to f/32, and for speeds from 1/1,000th second to 30 minutes.
- ★ The photo-electric cell is protected from all overhead light.
- ★ Suitable for either still or cine work. Compact and neat, measuring only 2½ × 2½ × 1½ in.

PRICE, complete with real pigskin ever-ready case £5:0:0

For further particulars, write to the Sole Importers and Distributors:—

THE NORSE TRADING CO. (London) LTD.
37, RATHBONE STREET, LONDON, W.

EVERY PAILLARD PROJECTOR PASSES THIS TEST

Before leaving the works, every Paillard projector has a section of unused film run through it 500 times. This film is then critically examined under the microscope for any signs of wear or scratching. Only projectors which can pass this test without any signs of film wear are allowed to leave the works. This is typical of the care that goes into every stage in the construction of a Paillard projector and explains why it can project a film scores of times without leaving any trace of wear.

Give your films a better showing on a Paillard-Bolex projector. There is a wide range of models to choose from and at the new reduced prices they are really wonderful value for machines in the "top-notch" class.

Ask your dealer for a demonstration, and judge by performance.

DO YOU KNOW THAT YOU CAN GET A PAILLARD-BOLEX 16-mm. PROJECTOR FOR £39:0:0?

The G16 is a super high-power projector similar to the famous G3, but for one film size only. Ask your dealer for details.

NEW!

Just Arrived from the Continent

Do you want a 35-mm. Camera with Range-finder, Lens and View-finder controlled by one lever and all working together at all distances? A 35-mm. camera with Shutter release on body and a film transport system that prevents overwinding; one finished in best leather and chromium plate?

No! the price is not £30. It is £14/10/0 with f/2.9 Trioplan, or £19 15/0 with f/2.8 Tessar. Compur shutter speeded to 1/300th in each case.

If you are thinking of changing over to miniature photography, this is the golden opportunity to obtain a guaranteed precision camera at a price previously unheard of for such an array of desirable features.

It is small and beautifully finished, apart from the highly-priced miniatures we consider it to be unbeatable in its performance. Come along for a demonstration or drop us a line. Deferred terms and part exchange with pleasure.

A SELECTION of SECONDHAND MINIATURES GUARANTEED IN EVERY WAY.

THE CAMERA YOU NEED AT THE PRICE YOU CAN AFFORD

40% lower priced than other cameras of similar specification. Over 1,000 sold on recommendations of satisfied owners alone—IT'S THE

VAUXHALL RANGE-FINDER MINICAM for £11:15:0 only

Yours for 20/7 down and eleven similar monthly payments.

VAUXHALL MINICAM OFFERS

you all the refinements of an expensive camera at a price you can afford. At the same time Vauxhall Minicams are manufactured with the same precision and quality of material as used for the most costly of photographic instruments.

WINTER PHOTOGRAPHY

The f/2.9 anastigmat lens alone makes the camera exclusive for its price, and is ideal for taking those indoor "shots" you have so often wanted to experiment with—Vauxhall will produce prints that will be a delight to yourself and your friends.

Remember, last year, those lovely Autumn landscapes you so often wished you could record—Vauxhall will bring the warmth of those golden tones to your snap album. Send for one of these remarkable cameras on 5 days' FREE approval against Full Deposit to value, or call and inspect.

Our CONFIDENTIAL Self-Financed Hire Purchase Terms make it possible for you to own this Camera without any noticeable call upon your purse. Our system is a confidential arrangement solely between you and us.

STANDARD MINICAM

(without coupled Range-finder)

With f/2.9 anastigmat, micrometer focussing mount, D.A. Compur shutter £6:19:6

Ditto, with unique radial focussing £7:19:6

Ditto, with Pronto D.A. shutter £5:19:6

Or 12 monthly payments of 12/3, 14/- and 10/6 respectively.

RUDY STARITA

was asked one day last
week (we hope the gen-
tleman in question reads
this):

"HOW DOES YOUR
PERSONAL
SERVICE
DIFFER FROM MANY
OTHERS?" He replied—

"Because PHOTOGRAPHY IS MY HOBBY,
which makes customers FELLOW ENTHUSIASTS."

THE BARGAINS OF THE WEEK.

FLOODLIGHT REFLECTOR**FOR INDOOR PORTRAITS**

This Floodlight Reflector can be used of any ordinary electric light system, no special wiring is necessary. The light given by a Nitraphot Lamp in conjunction with the Floodlight Reflector is extraordinarily intense; yet it is soft and well diffused. Well-exposed negatives can be obtained with an exposure of 1/5th second with a lens aperture of f/4.5.

The light from a pair of these Floodlight Reflectors is sufficient for using a cine camera indoors. One Reflector used on a tripod can be adjusted to any height up to six feet, while a second Reflector can be placed elsewhere to balance light or shade as desired. With these Reflectors the light can be made to fall upon the subject from above, from below, or from the side, and enables the amateur to experiment with various modes of illumination in his own home.

FLOODLIGHT REFLECTOR.
Complete with switch, 9-ft. flex with wall plug and lamp-holder adapter. Price 25/-

Extra 9-ft. Extension Flex. 5s. 0d.
Diffuser, extra. 2s. 6d.

GREAT END-OF-SEASON SALE of CINE APPARATUS

THERE'S A SAVING OF POUNDS FOR YOU ON ANY OF THESE INSTRUMENTS

Amateur Photographers! You can now afford to own a complete cine outfit. This great bargain clearance enables you to buy cine camera and projector at even less than one piece of apparatus would usually cost. Sooner or later you'll have to start home movies—what a chance to do it NOW. Don't miss it—prices are rising; by next spring similar outfits will cost you many pounds more. Send cash with your order now. You can have anything on 5 days' approval against full cash deposit. The extremely low sale prices do not permit of deferred payments or exchange allowances. All apparatus costing £10 or more is supplied with a printed three-year guarantee.

LEITZ 'VALOY'

Suitable for negatives up to 3 1/4 in. With baseboard and 20-in. upright. Projector head with large-size lamp-house. 75-watt bulb in centring mount for direct connection to the mains. Without lens, but with helical movement to take Leica lens or special enlarging lens. £9:11:6

15 monthly payments of 13/5.

FILMSOUND '138'

Single case, 16-mm. sound-on-film projector, 1,600 ft. capacity, light in weight. Provides theatre quality reproduction of both sound and picture. Will project your own silent films as well as sound library films. £138

24 monthly payments of £6 3 8.

'BOLEX' G.916

For both 9.5 and 16 mm. Films. This machine is entirely gear driven, there being no belt whatever. With Dallmeyer 2-in. projection lens, including all accessories, to project both sizes of film, and 11-in. 1/2.5 lens. £45

24 monthly payments of 40 4.

KODASCOPE 'EE'

With dual purpose case, which is handy for carrying purposes and also acts as a substantial vibration-proof base when the Kodascope is in action. There is also a 30-in. tilting device for accurate centring. Provided with 300-watt lamp. With 11-in. 1/2.5 lens. £32:10:0

24 monthly payments of 29 2.

SIEMENS 'SIXTEEN-9'

Takes 9.5 and 16 mm. films. Has 200-watt lamp, speeds 12-28 pictures per sec., motor rewind. Single-picture device. Silent take-up. Self-contained resistance. Centring device and safety switch. £59:10:0

24 monthly payments of 53 4.

PROJECT YOUR LEICA SIZE COLOUR OR BLACK AND WHITE TRANSPARENTS ON A SIEMENS OR FILMO PROJECTOR.

The new 25-mm. attachment is now available at Bond St., it is easily attached and shows your Leica or similar size pictures in tremendous proportions on the cine screen. The price of the attachment for Siemens projectors is £7 0 0. For Filmo a special lens is needed (price £2), in addition to the attachment, which costs £8. Let us give you a demonstration.

ILFORD

**HYPERSENSITIVE
PANCHROMATIC PLATES**

Haven't you noticed how everyday scenes and subjects take on a different, fascinating aspect after dark? Those lamp-light reflections on rain-listening roads—the noble façades of floodlit buildings—if only you could capture them with *your* camera . . . You can to-night—thanks to Selo Hypersensitive Panchromatic Roll Film and Ilford Hypersensitive Panchromatic Plates. Such is their remarkable speed that almost every street or square presents its opportunity for a perfect picture. Indoors, too, you can make charming studies of home life and really natural portraits. It's all so simple and so original.

Wednesday, November 3rd, 1937.

No. 2556.

PHOTOGRAPHS *by* CANDLE LIGHT

WITH THE

Leica

When the November fogs make outdoor pictures impossible—there are still many hours of pleasure to be enjoyed by taking indoor photographs with the Leica. Interchangeable lenses with apertures as large as f/1.5 allow of snapshot exposures in the most primitive lighting conditions.

"Leica News and Technique," a bi-monthly illustrated journal, is distributed free of charge to all Leica users in Britain who register their camera number with us. A specimen copy is gladly sent free of charge on request.

Ask any good class dealer for a demonstration, or write to us for full descriptive literature.

E. LEITZ (LONDON), 20, MORTIMER STREET, LONDON.W.1

KODAK

NEWS

Shots after dark . . .

Yes, *anyone* can do it—with any camera that will take Brief Time exposures. Once you have got your lighting equipment—and 2 Photofloods and 2 "Kodaflector" reflectors can be bought for a total cost of 11/-—there is almost no limit to the variety of home subjects at your command. Load your camera with Kodak S.S. Pan. film—particularly sensitive to artificial light—and you can give very brief time exposures, or even snapshots with a fast lens camera.

Night Photography is **Simple, Fascinating, Inexpensive** with

KODAK SUPER SENSITIVE PANCHROMATIC FILM and the KODAK NIGHT PHOTOGRAPHY AIDS

Ask your Kodak dealer for the fully illustrated booklet, "How to take Pictures at Night"—or write to Mr. A. P. Taylor, Dept. 57b,

KODAK LIMITED, KODAK HOUSE,
KINGSWAY, LONDON, W.C.2.

How this picture was taken:

2 Photofloods in "Kodaflectors";

Kodak S.S. Pan. film; f3.5, 1/25th second.

"SHIPS AND THE SEA"

SEND IN YOUR ENTRIES NOW FOR THIS WALLACE HEATON COMPETITION

It doesn't need us to tell you what beautiful pictures you can make for this section of our Competition. The open sea, the fishing boats, the net-mender, the forest of masts in the harbour, beautiful sunsets over angry waves. Every thought of the sea creates an idea for a competition entry. As long as you are an amateur you stand an equal chance of winning a prize with the rest of the competitors—but, remember, it's the excellence of the photography that counts.

ANY AMATEUR MAY ENTER USING ANY CAMERA OR MATERIALS

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA or MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning photograph and negative

becomes the property of Wallace Heaton Ltd. without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules etc., is a condition of entry.

A selection of the best entries will be held back at the close of the competition for exhibiting in our galleries prior to their return.

Last week's prize-winner—"Ships and the Sea" Competition: J. K. Neale, Northcliff, Penarth, Glam., with snap entitled "Fair Wind."

ADDRESS YOUR ENTRIES TO "SHIPS AND THE SEA" COMPETITION,

WALLACE HEATON LTD., 127, NEW BOND ST., LONDON, W.1

P Panchromosa Special Roll Film has similar properties to Panchromosa but is slightly slower and possesses extremely fine grain. It gives negatives capable of considerable enlargement.

for Indoor work Panchromosa

Panchromosa Roll Film is ideal for work under artificial light. Its panchromatic emulsion in such circumstances has the high speed of 30° Scheiner, making short exposures possible. For outdoor work Panchromosa has a speed of 28° Scheiner.

If you want the best home entertainment—send now for our film library lists. We have every film worth having.

500-watt KEYSTONE PROJECTOR

Including splicing outfit, reel, brush, etc., universal motor drive, f/2.5 lens, finely ground and polished, capacity 400 ft., die-cast construction, Hi-gear motor rewind, knob swivel device for tilting.

Cash price **£27 : 10 : 0**

24 monthly payments of 24/8.

IF IT'S NEW—WE HAVE IT!

NEW! PATHESCOPE "S" 9.5-cm. DE LUXE PROJECTOR

For 300-ft. and 800-ft. Reels. Sprocket Fed.

A high-class home cinema built on professional lines. Made of high-quality die castings, the "S" is run by a non-commutator, synchronous motor which ensures very smooth running at a speed of either 16 or 24 pictures per second and is guaranteed not to cause radio interference.

Fitted with a high efficiency, low voltage, high amperage 200-watt lamp (15 volts, 13 amps.) and is transformer fed to avoid an increase in current consumption from the mains. The lamphouse remains cool throughout projection. The guideway and the presser pad are easily accessible for thorough inspection and cleaning, while, following projection, the 800-ft. of film can be rewound by motor—33 minutes' projection without changing reels. Built-in pilot lamp. Arrangement of the optical system ensures steady, flickerless projection and incorporates a racking device.

For use on all A.C. mains from 110 to 250 volts. Cash price **£30 : 0 : 0**

24 monthly payments of 26/11.

NEW! 'KODASCOPE' 50-R 8-mm. PROJECTOR

A new, improved projector for 8-mm. films. The extra-powerful 200-watt lamp gives an exceptionally brilliant picture measuring 30 x 22 in. when the Kodascope is placed 14 1/2 ft. from the screen, or 40 x 30 in. at 19 ft. The projector can be used on any circuit by means of small interchangeable plug-in resistances. Fast motor-driven rewind, large cooling fan and sturdy construction are among its features.

Price, including 1-in. lens and accessories..... **£13 : 13 : 0**

24 monthly payments of 12/3.

A MESSAGE FROM OUR MANAGING DIRECTOR

"In co-operation with the managers of City Sale and Exchange Ltd., the greatest care has been taken to see that anything new is first for sale at each of the nine London shops which I control. I leave you in their trustworthy hands, fully assured that you will receive first-hand expert assistance and advice on whatever instrument may be concerned."

Wallace Heaton

Not many firms, if any at all, can show you such a wonderful range of minicams as ours. We have every accessory, too. Any minicam costing £10 or more can be yours to use on payment of the first of 24 monthly instalments.

Achieve professional standard
with the 'EXAKT' enlarger

The simple, speedy enlarger with
fool-proof automatic focussing

Here's an enlarger that trade-workers throughout the country are installing—a sure sign of its efficiency. The Exakt is an instrument that would bring joy to any amateur to possess—it's so easy to use, so accurate, and by no means expensive. You haven't experienced the real thrill of perfect enlarging until you have used an Exakt. Ask your dealer to give you a demonstration. Its easy ingenious focussing is absolutely fool-proof—an enlarging scale and focussing scale are set at the same figure and perfect sharpness is instantly obtained. The mechanism is so rigidly constructed that the perfect focussing cannot accidentally alter, however big a batch of work you are doing. Special value is attached to the interchangeability of lenses, but a STEINHEIL-CASSAR f/4.5 is supplied as standard equipment with all models. The Exakt is supplied in four sizes, for all size miniature negatives up to 9 × 12 cm., at prices ranging from £14.

A user writes:

"The solid construction, combined with the excellent lens and the faultless electrical equipment, makes this instrument a product of which the firm has every right to be proud."

A Small Corner of the Window (only)!

That is all that we can show you in this space. To cover the whole WESTMINSTER Stocks—remember each separate one of the "Four Westminsters" is fully complete in itself—would take many pages and a very long time to look through and read. But whatever you may need in Things Photographic—Ciné and Still—you can be sure of getting at the WESTMINSTER; on the fairest, simplest, safest EXTENDED PAYMENTS Terms available.

The NEW ROLLEIFLEX

In this new model the 6×6 cm. ROLLEIFLEX for 12 pictures on usual 3½×2½ spool becomes more than ever automatic, revealing a still higher standard of optical and mechanical perfection. Only one action is now needed to—

(1) set the shutter; (2) safeguard against either blank or double exposures; (3) to give delayed action. There are also amongst other improvements new controls for shutter speeds and lens apertures, with magnified readings. The reflex hood is fitted with larger magnifier and there is a double magnifier and additional mirror for eye-level use. Lens is f/3.5 Tessar, with Compur Rapid shutter speeded to 1/500th sec.

Price £31:5:0

12 monthly payments of 54/8, 24 of 27/4.

ROBOT

The Camera that does everything for you

An entirely new and original camera of novel design and ultra-modern features. More completely automatic than any camera yet devised. Takes 48 square pictures on usual 35-mm. cine film, with daylight loading and removal of whole or part of film, film winding and shutter release simultaneously, and permitting automatically up to 24 exposures in rapid succession, with one movement only, if desired. Special "zonal" focussing system, taking place of range-finder. Shutter closely graduated 1 to 1/500th sec. With f/2.8 lens. £29:10:0

12 monthly payments of 51/8, 24 of 25/10.

Interchangeable Schneider Tele-Xenar f/5.5

£10:0:0

With f/3.5 lenses from £23 10 0

ROLLEICORD Ia New Popular Model

A high-grade camera with "a name behind it," offering all the advantages of the twin-lens design at a most attractive price. Gives the usual Rolleicord picture 2½ square (12 on normal 3½×2½ spool) and comprises most of the noted Rolleicord features. With f/4.5 Zeiss Triotar anastigmat, Compur shutter, 1 to 1/300th sec., T. and B. automatic film winding, metal body with leatherette covering.

£12:10:0

12 monthly payments of 21/11, 24 of 11/-.

NOV. 2-6.

Do you know what this is ?

The illustration shows the arrangement of levers (patented) on the Compur shutter used with the Super Ikonta II for $3\frac{1}{4} \times 2\frac{1}{4}$ " pictures. These levers work in conjunction with the interlocking arrangement on the camera and prevent unintentional double exposures.

When the shutter release on the camera body is pressed, the lever "A" actuates the release lever "B" on the shutter. Then the exposure takes place, after which the lever "A" springs back to its usual position and the locking device "C" falls forward in front of it, so that the shutter release cannot be operated again until the shutter has been reset and the film wound on.

Of course, intentional double exposures for special effects, e.g., trick photography, can easily be made by pressing lever "A" with the finger, or by using a wire release.

The Super Ikonta, illustrated, is equipped with Zeiss Tessar f/3.8, Compur Rapid shutter to 1/400th second, and focussing is performed by coupled distance meter. Other models providing somewhat similar advantages for $2\frac{1}{4} \times 1\frac{1}{4}$ " and $2\frac{1}{4} \times 2\frac{1}{4}$ " pictures are also available.

SUPER IKONTA

Our interesting book "Miniature camera advantages, but with large size negatives" tells you all about the Super Ikonta. Write for a free copy, or ask your dealer for a demonstration.

VOL. LXXXIV. No. 2556.

THE Miniature Camera Group filled the hall at Russell Square to the doors at the first meeting of its winter session. Never was there such an eager crowd as those who have taken up the miniature. The subject was colour work, and the exponents of Kodachrome and Dufaycolor attended to proclaim the respective merits of their processes. The fact that one is a subtractive process and the other an additive took a little off the edge of competition, and the two exponents struck up something of an alliance against those who complained of colour results because they were not as yet quite the last word. One speaker said he had exposed both these materials, but he would not care to show more than twenty per cent of his results, and his complaint was that the manufacturers did not give enough guidance. To this one of the exponents, apparently with the assent of the other, replied spiritedly that manufacturers took it for granted that advanced photographers—amongst whom must certainly be counted miniature camera workers—were persons of high intelligence, who liked to experiment for themselves, and if the manufacturers told them everything they ought to do, where, then, was the experiment?

Progressive Dealers.

A few years ago the number of photographic dealers who stocked expensive apparatus might almost be counted on the fingers of both hands. To-day the list of actual stockists of high-class miniatures and ciné apparatus that appears each week in our Index to Advertisers, arranged in town order, covers nearly every county in the Kingdom. Nowadays, readers in

TOPICS of the Week

NOVEMBER THE FIFTH.

*An article on Firework Photography
appears on another page in this issue.*

all parts of the country can actually examine and compare different models of up-to-date cameras within a short distance of their own homes, and enjoy facilities on the spot for service, exchanges and, if required, hire-purchase terms. Furthermore, this modern type of dealer is, of necessity, fully acquainted with the intricacies of both apparatus and processes, vastly different from many dealers of a decade or so ago, some of whom had little knowledge and less interest in photography beyond receiving films for D. & P. work. We welcome this trend in affairs, and the more these progressive dealers in photographic goods become known to our readers the better for the continued and sustained interest in all-the-year-round photography.

"How I Wonder What You Are!"

The 33rd Traill Taylor Lecture delivered last week by the Astronomer Royal on photography as an aid to the exploration of the universe was a most fascinating affair—so fascinating that the gentleman who was to propose a vote of thanks acknowledged that he felt himself dazed and unable to frame his sentences. Dr. Spencer Jones began by describing how photography had supplanted visual observation in the measurement of stellar distances. Previously, over very many years, only thirty or forty star distances had been worked out, but when photography came in for this purpose the pace quickened immeasurably, and five hundred such distances are worked out every year. It is odd to think that the nearest star is photographed by light that has been travelling through space for three and a quarter years. Still more odd to think that the most distant star clusters are being

photographed by light that has taken 125 million years to journey from its source in unthinkably remote universes to the photographic plate—that in fact the light was nearing the end of its journey to the earth before man appeared on this planet. Dr. Spencer Jones paid a high tribute to the makers of photographic plates for their emulsions which met the exacting requirements of the astronomer. The advances in modern astronomy would never have been possible but for specially fast plates with high threshold sensitivity, which had no use save in these astronomical applications.

Praise, Faint and Otherwise.

The familiar trial of those who are shown any new work in the presence of its author is to find words to convey a reasoned appreciation, no gush, no refuge in clichés, but a discerning criticism. How often has this happened with a friend's photographs! Of course, following the historic example in which a bachelor and a baby were concerned, one could say, "Well, that is a photograph!". Thereby one has satisfied the demand to speak the truth and has not hurt anybody's feelings. Some new ways of doing it were suggested by the

comments made on the occasion of the private view of Mr. Epstein's two-and-a-half-ton "Consummatur Est." Lady Oxford, for example, after a brief inspection, came away remarking, "I can say nothing—nothing." That is a form which may be generally commended. It is non-committal, and yet it suggests, especially by the repetition of the word "nothing," a soul overcharged with emotion. The proud producer of the work can suppose that it was admiration, his enemies the reverse, and all are satisfied. But the opportunity is not given to all critics to voice their opinions so ambiguously.

"The Amateur Photographer" EXPOSURE TABLE—November

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 9 to 10 a.m. or from 2 to 3 p.m. double these exposures. From 8.30 to 9 a.m. or from 3 to 3.30 p.m., give treble or more.

SUBJECT.	Ultra-Rapid.	Extra-Rapid.	Rapid.	Medium.	Ordinary.	Slow and Process.
Open seascapes and cloud studies	1/250 sec.	1/150 sec.	1/100 sec.	1/50 sec.	1/25 sec.	1/15 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes	1/150 "	1/75 "	1/50 "	1/25 "	1/15 "	1/8 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/75 "	1/50 "	1/25 "	1/15 "	1/8 "	1/4 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes	1/50 "	1/25 "	1/10 "	1/8 "	1/4 "	1/2 "
Buildings or trees occupying greater portion of picture	1/15 "	1/8 "	1/4 "	1/2 "	1 "	2 secs.
Portraits or groups taken out of doors, not too much shut in by buildings	7/8 "	1/4 "	1/2 "	1 "	2 secs.	4 "
Portraits in well-lighted room, light surroundings, big window, white reflector	1/2 "	1 "	1 1/2 "	3 secs.	6 "	10 "

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above.

Using FASTER FILMS and PLATES

Shorter days and weaker light turn

the attention of the amateur photographer to faster materials. The following article gives some useful hints upon this topical subject.

THE present time of the year sees many photographers changing over to faster plates or films. The lighting conditions out of doors are less favourable to instantaneous exposures, and in these days few photographers wish to carry a tripod. There is also the desire to carry on photography indoors, or to experiment with the many subjects to be found out of doors under artificial lighting at night. Many workers, however, especially beginners, are disappointed with their first attempts with super-rapid material, through lack of attention to essential points.

Sensitivity.

One of the first points that the user of these materials, particularly those of panchromatic type, needs to grasp is that high speed is secured by making the emulsion sensitive to certain light rays. For example, the light which emanates from a gas-filled electric bulb is composed of a considerable proportion of red rays. The highest-speed panchromatic material is made very sensitive to these rays, and for that reason very short exposures are possible with them.

This is why most makers give two speed numbers for their super-speed panchromatic films and plates, the higher rating being for artificial illumination, and indicates that the material is highly red-sensitive.

It is sometimes asked whether panchromatic material is more rapid by daylight than that of the same marked speed of orthochromatic type. Actually, the difference under normal daylight conditions is very small, and will only be noted if there is a definite coloration in the light, as for example towards sunset, when the lighting has a very pronounced red tint. It is under these conditions that the panchromatic plate or film retains its speed, while that of the less sensitive type becomes relatively slower.

In the case of subjects obscured by mist the panchromatic emulsion, used in conjunction with a deep filter, will penetrate haze or mist and render detail that could not be secured with the other type. Another point with

regard to the consideration of the speed of the different material, is that filter factors are lower with panchromatic plates and films, yet at the same time provide superior correction.

The Camera.

With regard to the use of the very fast material it is necessary to pay some attention to the camera. It is realised that these plates or films are very sensitive, and it is necessary for the apparatus to be in first-class order. Cases of mysterious fog on negatives occasionally occur that can be traced to defective light-trapping of the velvet of the plate-holders. These may be quite satisfactory when slower plates are used, but there may be a distinct indication of fog when super-rapid panchromatics are employed. It is also necessary to expose the plate-holders to light as little as possible.

In the Dark-room.

It is perhaps hardly necessary to point out that these plates or films demand great care in the dark-room, if the negatives are to be free from fog or veil. The user of panchromatic material must make up his mind to dispense with light, because even a safelight cannot be used without some risk. Again, a light that may be safe when used with care for lower-speed panchromatics is not what its name implies when material of greater speed is exposed to it.

The same applies when using orthochromatic films or plates of high speed after using slower material of the same type. The safelight may not be equally safe with materials of the higher speed. It is best to screen the plates or films by interposing the body between the light and the dark-room table on which operations are conducted, the light source being behind the photographer's back.

Exposure.

It must be realised that high speed in photographic material is secured at some cost in latitude, and in order to secure the best results it is necessary to ensure correct exposure. The best course is to use an exposure meter,

and over-exposure must be avoided, as this will result in a flattening of the high-lights. For many subjects at this time of year over-exposure is not likely, but it must be guarded against when working out of doors during bright sunny periods of the day.

For out-of-door subjects it is better not to use the fastest panchromatic material, except when the lighting conditions are very poor. The reason for this is that many of these plates or films give soft contrast, and this may be undesirable for some winter subjects. The best course is to use ortho plates or films giving negatives of the vigorous type. Many of the super-rapid panchromatics are intended for studio portraiture, and are not so well adapted for daylight exposures. The films intended for small or miniature cameras are of a rather different type, and all of these will give sufficient contrast, if properly used.

Development.

Those photographers who use a tank for development, and a developer based upon a time and temperature system, will find that most super-speed material is placed in a class for which longer development is indicated. If development is conducted by inspection the worker must be careful not to under-develop. A peculiarity of the super-fast plate or film is that development proceeds normally up to a certain point, and if the plate or film is fixed at this stage the negative almost certainly will be weak in contrast. It has been suggested in some cases the speed that the makers claim is lacking, but the fault is often that of the photographer through neglecting to give full development.

The "miniature" worker will doubtless use one of the fine-grain developers for his films, and the same course may well be recommended for the user of larger sizes as well. It is known that the super-rapidity is secured at the expense of fine grain, and when it is thought that enlargements of some size are wanted, fine-grain development is advocated. This will also serve to avoid under-development, if used for a fixed time.

A blaze of rockets over the sea. F/8, fast Pan. film.

FIREWORKS will be in the forefront of the minds of many people, young and old alike, on the evening of November the Fifth. For those photographers who like to exercise their skill all the year round and do not treat photography merely as a summer hobby, the Guy Fawkes night festivities provide an opportunity for striking outdoor subjects that should not be missed.

Fireworks, seen photographically, can produce some very beautiful results and make very effective night pictures. They do not call for elaborate photographic apparatus, or even for great skill or experience on the part of the photographer. Any kind of camera may be used, even the simple box type, provided that a fast film is employed. Since most fireworks give a coloured light panchromatic films generally give the best results, but any of the 'chrome

films, which are also very sensitive to certain colours, may be used if preferred.

The secret of success for this type of exposure is "time exposure." For all ordinary sorts of fireworks, such as rockets, roman candles, etc., a good result can only be obtained by giving a time exposure, though certain elaborate set pieces in which there is rapid movement may call for an instantaneous snap. In general, therefore, a tripod or some other form of steady support for the camera will be required.

The most difficult part of the whole business is undoubtedly the choice of position in which to set up the camera,

Firework

A TOPICAL SUBJECT FOR
EVERY CAMERA USER

Rockets, maroons and roman candles. Time exposure, f/11, fast Pan. film.

A variety of fireworks taken on one film during a prolonged exposure. F/8, Pan. film.

since it will be obvious that this has to be done in advance by guesswork before the fireworks are let off. When photographing a small garden display at home this does not present much difficulty. But when taking pictures from a distance of a large-scale public show, the problem is greatly magnified by the limitations imposed by the situation in which the display is being given.

Having chosen roughly the position from which it is desired to "shoot," it is a good plan to watch the flight of the first few fireworks in the view-finder of the camera, so that the position may be changed if it is found that the fireworks appear too small, or, alternatively, if

Photography

By ROBERT W. NEWBY.

the camera has been set up too close. A direct-vision view-finder is the most suitable for this purpose.

If it is not possible to find the ideal position it is usually better to have the whole spread of the firework well within the picture, even if it appears small, than to be too close and see only a portion, since the appropriate part of the picture can always be enlarged afterwards.

When choosing a vantage point, the direction of the wind should be taken into consideration. The best results are obtained with the wind blowing the fireworks sideways across the picture. At all costs avoid having the smoke blown towards you.

Once the camera has been set up in the most suitable position all that remains is to wait for some likely items on the pro-

Falling points of light registering as graceful curves. Box camera, f/11, shutter open for 1 minute.

is plenty of latitude with this type of subject, however, and although there is, of course, an absolutely correct exposure for every occasion, double or half this exposure will in nearly all cases yield a fairly satisfactory negative.

When making the exposure take several photographs on the same film, without, of course, moving the camera, so that the picture creates the impression of a big display.

Firework display at the Paris Exhibition.

gramme in order to make the exposures. The aperture should be set at the largest possible if a simple camera such as a box is being used. This is generally about f/11. If a faster lens is available f/8 may be used with advantage for the brighter types of fireworks, while others less brilliant may require an even larger aperture if possible. Since time exposures are to be used the lens stop is the only variable and no hard and fast rules for the choice of this can be laid down, but must of necessity be left to the judgment of the photographer. There

The grand finale. All these fireworks were released at once.

Readers' Hints, Tips and Gadgets

A COMBINED PAPER-HOLDER AND MASKING DEVICE.

THE combined bromide-paper holder and mask described here costs only a few pence to make, but is a very efficient piece of apparatus.

It is intended for use on the enlarger easel, as shown in the diagram, and is held in place by drawing-pins at the base and a strong elastic band at the top. Removing an exposed sheet of bromide paper and inserting an unexposed one is done in a second when this holder is used, and uniform white borders round the print are produced with ease and certainty.

The back of the holder marked C in the diagram is a piece of stiff strawboard, and this should be cut to such a size that it fits comfortably on the enlarger easel and leaves a good space all round. A and B are the same size as C but are cut from card about the thickness of ordinary postcards. When the holder is in use the paper is held in the opening cut in card B, and it is a good plan to mark this card for cutting by laying a piece of bromide paper (of the size that is to be used) in the centre and marking round it with a pencil. This will ensure that the paper will slip easily into place when the holder is completed. Card A forms the mask, and the size of the piece cut from its centre will determine the width of white border left round the prints.

When cards A, B and C have been cut, the holder is ready for assembling. This is done as follows: Cover one side of card B with glue, lay it down on card A and put under pressure. When the glue is firmly set, draw a line at right angles to the base and about three-quarters of the way up, and cut completely through both cards with a sharp knife. Leave the top portion on one side and cover card B with glue, place on card C and again put under pressure and leave to set. Place the top part

of cards A and B in the original position and fix with gummed strip as shown in diagram.

The holder is now complete, and can be fixed to the enlarger easel with drawing-pins and an elastic band as shown. To insert a sheet of bromide paper, lift the elastic band and let

ENLARGER EASEL. Showing mask in position.

the hinged part of the front cards fall down. Slip the paper down into position behind the mask, lift the hinged portion of the front cards back, and secure again with the elastic band.

W. R. HINDLE.

WHEN WEIGHING CHEMICALS.

THOSE amateurs who weigh out their own chemicals usually make a practice of putting a slip of paper on each pan of the scales—one to ensure cleanliness and prevent chemical corrosion of the metal, and the other, of equal size and thickness, to justify the weight. It is not always easy to find clean paper of the right kind just when it is wanted, and sometimes one may be forced to use expensive stationery for the purpose. The paper usually has to be small, and it is often found that certain substances, particularly crystals, will slide or bounce off when shaken out of the bottle. Some small improvement may be effected by folding the paper twice (crosswise) so that it forms a shallow receptacle, but this means additional time and trouble, and is not very satisfactory. The ideal method, I have found, is to use small paper baking cases as sold for confectionery work. Being machine-made, they are absolutely equal in weight. While they are small in area, and so go on to the pan easily, they are deep enough to hold a large quantity of the chemical, none of which can be lost or spilt as with a flat paper. Each item should be weighed in a fresh case, and put aside in its correct order as given in the formula. When the cases have been emptied of their contents they should be destroyed, thus eliminating any risk of contaminating one chemical with another. These cases are easily obtained, and the cost is negligible.

F. BAGLEY.

PACKING PRINTS FOR POST.

THERE are times when every photographer sends prints by post. Suitable card for protecting these prints is not always quickly available. As most photographers use writing pads, it is useful to know that the card backing the pad is of a very useful size. If the pad is the usual 8vo size, the card on which it is mounted very neatly protects a half-plate print, while if the pad is 4to size the card will be found to protect a whole-plate print. Save the cards on which your writing pads are mounted as they may prove very useful. And don't forget that every packet of bromide paper contains at least one sheet of cardboard to protect its contents.

J. R. MENZIES.

NON-SLIP SQUEEGEEING.

IF, when squeegeeing, you find that prints show a tendency to slide over the glazing plate, try the following very simple system:—

Position the prints on the plate, cover them with four to six thicknesses of newspaper and squeegee lightly to remove excess liquid. Replace the newspaper by a single sheet of blotting-paper a little larger than the glazing plate. Fold the protruding blotting-paper round the edges of and under the glazing plate. It is then possible to squeegee vigorously on top of the blotting-paper without the prints slipping. The blotting-paper, if dried after use, can be used a very large number of times.

Ensign INDOOR LIGHTING EQUIPMENT

MULTIFLOOD OUTFITS

**BRILLIANT LIGHT JUST
WHERE YOU WANT IT.**

These outfits enable the intense light from "Photoflood" lamps to be concentrated on the subject. The reflector is mounted on a universal joint which enables the light to be projected in any direction—upwards, downwards or sideways. The wire stand will stand or hang anywhere.

MODEL 1. Outfit includes stout cardboard reflector, fitted with bakelite lampholder, 6 ft. of flex and plug, and universal head stand. Complete in box (without lamp).....**6s. 6d.**

MODEL 2 (illustrated). Outfit includes strong aluminium reflector, fitted with bakelite lampholder, 6 ft. of flex and plug, and universal head stand. Complete in box (without lamp).....**10s. 6d.**

LAMPS. Osram Photoflood Lamp **2s. 6d.**

PHOTO FLASH-BULB OUTFITS

Operated from an ordinary torch battery. Ensure instantaneous pictures without smoke, smell or noise.

COMPLETE OUTFITS with Philips Photoflux Bulbs.

No. 0. Complete with 2 small size flash-bulbs, Silverlite folding reflector, torch, battery and test bulb.....**5s. 6d.**

No. 1. Complete with 2 small size flash-bulbs, torch, battery, test bulb and Multiray metal reflector.....**12s. 6d.**

SYNCHRO-FLASH OUTFITS

A simple means of ensuring perfect flashlight pictures. Both the shutter of the camera and the flash-bulb are controlled by the camera-release. Easily fitted. For operation with flash-bulb or flash-powder.

Illustrated below is the **Model No. 1 Powder Outfit**, for use with flash-powder only. Fitted with a reel of fusewire, which makes the preparation for firing the powder speedy and simple.....**27s. 6d.**

Other Models from.....**11s. 6d.**

THE NEW SUPER ACTINIC GEKA ELECTRO-FLASH LAMP OUTFIT

Flash-powder is contained in capsules which are screwed into the holder carrying a small battery. The open end of the capsule is closed with "Cellophane," the fuse being buried in the powder and is fired by a switch in the handle, fitted with a sliding cover to prevent premature ignition.

The flash is instantaneous, and highly actinic, while only a trifling puff of smoke is emitted, clearing in a few seconds.

Complete Outfit, including holder, tray, battery, 2 capsules and test bulb...**10s. 6d.**

Extra Capsules, in box of 3.....**2s. 6d.**

Ask your dealer for a copy of latest booklet "On the Art of Lighting for Indoor Photography," or write to **ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1**

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

AT the point-to-point meeting the miniature camera really comes into its own. For this type of work speed of shutter and speed of action are absolutely essential. The field teems with a multitude of pictures of varying types, and the rapidity with which a miniature camera can be switched from a high-speed racing picture to a more subdued study of people and surroundings makes it a boon to its fortunate owner.

The Miniature in Crowds.

Another benefit is its adaptability in crowds. At the best vantage-points there is seldom much elbow-room, and a camera that can be manœuvred with ease is a certain blessing.

Point-to-point races are often run in indifferent light, so the wide aperture is imperative for use with high shutter speeds. Even with $f/3.5$ and $1/500$ th second exposure it is useless to attempt

At the Point-to-Point

By DAPHNE BURTON.

and made more impressive. At the same time there is much less danger of finding, when the film is developed, that the horse has been taken at an instant when its outline is obscured by a tree or spectator, for the lower viewpoint tends to bring the horse and its rider against the sky.

A Dangerous Spot.

The water jump is sometimes a more difficult problem, for it is unwise to stand too near, as horses refusing do all sorts of unexpected things. One must keep a wary eye, too, for the riderless horse. For which reasons the low viewpoint is best got with

If the photographer can get to the races by himself he can spend the time between the events wandering happily around the bookmakers' quarters, getting a series of gloriously natural pictures. Nor should he miss the opportunities of the various tricksters at work, or the gambols of those gentlemen who beseech us to "find the lady" or to win an easy fortune in some other equally impossible manner.

Technical Points.

The careful choice of film is wise. Speed allied to good enlarging qualities is the most important factor to consider. For this type of work one can waive tone values and accurate shade renderings which demand panchromatic film on other occasions. A lens hood is a wise precaution but filters are not needed.

Focussing must needs be pretty accurate where the jumping is concerned, as the wide aperture required does not give much latitude in this respect. For the scenes around the bookmakers' stands or among the spectators choose the slowest speed and smallest aperture that the prevailing light permits.

Owners of cameras that are not fitted with a depth-of-focus collar should work out or look up their own scale and, copying it on to a small stiff card, carry it always with them. Messrs. Leitz publish tables that may be taken as valid for any 24×36 mm. or 3×4 cm. camera.

"WELL CLEARED, SIR!"

broadside views of the horses. With a little skilful wangling it is usually possible to get an angle view of the jumps which is pretty effective.

Another benefit of the high-speed shutter is to combat the enthusiasm of one's friends. They do not hesitate to give one a hearty slap on the back if their horse is first over the sticks, and camera or no camera one has to accept their enthusiasm with a smile.

High and Low Viewpoints.

An eye-level finder is another necessity, and height in the operator is an unqualified blessing, for work can be done over the heads of the surging crowds. But a high viewpoint is not always the best. In photographing a jump, it is often a good plan to kneel on the ground, or to use a reflecting (waist-level) finder and hold the camera low. By this simple and well-known device the height of the jump is exaggerated

NECK AND NECK.

a reflecting finder; one's position lends itself better to sudden dodging.

The best jumps to frequent for mass formation are the early ones. The riders have not spread out and the crowds are usually too lazy to walk so far. Get to the jump in good time to ensure a steady hand. A breathless dash across uneven fields is a frequent cause of camera shake, which is always more prevalent with a light camera than with a heavier one.

THEIR PRIVATE GRANDSTAND.

Stereoscopic Colour Projection

By BERNARD ALFIERI, Jun.

Fig. 1. Fitting the prismatic taking device to a Leica camera.

Fig. 3. Fitting the prismatic device to a Leitz projector.

Fig. 4. The projector complete, showing the twin slide in the carrier and the polarising filters in position.

WITH the aid of new accessories that will shortly be available in this country, it will be possible for Leica users to take instantaneous colour photographs with their miniature camera, and to project them as coloured stereoscopic pictures. The taking portion of the apparatus is known by most miniature enthusiasts, and has

Fig. 2. Using the camera for taking a stereoscopic photograph.

been in use for some time. It consists of a prismatic device which is fitted in front of the lens of a Leica camera as shown in Fig. 1, the apparatus being used in the hand for instantaneous photographs as shown in Fig. 2. Where slow exposures are required the camera can be used on a tripod in the usual manner, but owing to the high speed of some of the modern colour films, it is often possible to make the exposure in the usual way. The prismatic device divides the area of the film into two, and duplicates the subject so that the paired images occupy the usual 24×36 mm. frame, each being roughly 18×24 mm. This device is obviously also suitable for black-and-white work.

Small slides are bound up from the paired images, and these are used in a special carrier which fits the standard Leica projector. In front of the lens of the projector a separate prismatic device is fitted as shown in Fig. 3. This splits up the projected image, so that each of the paired subjects is projected through a separate window.

These windows, which are clearly seen in the photograph of the complete projector, Fig. 4, are covered with small polarising screens with their vibration planes at right-angles to each other. Two overlapping images would be seen on the screen if viewed in the usual way, but to view the picture stereoscopically a pair of spectacles is worn, as shown in Fig. 5. The glasses of these are made from polarising screens, and the relative positions of the two glasses are arranged to coincide with the angle of the polarised images, so that each eye can only see one picture. In this way the two projected images are merged by the brain in the usual manner, resulting in the effect of a stereoscopic image. Unfortunately, if such pictures were projected on an ordinary white or cloth screen, the reflected light would be depolarised, but the use of a metal screen, or a screen with a metallic surface, overcomes this difficulty, and enables the pictures to be seen correctly.

Fig. 5. The polarising spectacles through which the twin projected images are merged.

Modern Miniature Cameras

CONTAX MODEL II.

THE Contax II is an advanced camera of the "true miniature" type, taking up to 36 pictures, each 24×36 mm. in size, on a length of standard 35-mm. cine film. It has all the refinements associated with cameras of its class, including interchangeable lenses, coupled range-finder, and interlocked shutter and film-wind. The dimensions of the camera body, over all projections, are $5\frac{1}{2} \times 3\frac{3}{8} \times 1\frac{11}{16}$ in., the thickness being brought up to $2\frac{3}{8}$ in. by the 5-cm. f/2 Sonnar (in collapsible mount) fitted to the camera sent for review. The total weight of camera and lens is $26\frac{1}{4}$ oz.

The lens, which is instantly detachable, is fitted in a bayonet socket and locked by a spring. For focussing, the flange into which the lens fits is rotated by turning a small milled wheel on the top edge of the body, and the same action operates the range-finder. This is combined with the view-finder in such a way that the doubled image of an object incorrectly focussed upon is seen in a small yellow rectangle in the centre of the view in the finder. A focussing scale, with depth-of-focus collar, is provided, and at any setting of the

focussing scale it shows the depth available at all apertures. The long base of the range-finder—it runs practically from end to end of the camera—endows it with a very high accuracy; an error in focussing equivalent to less than half the depth of focus at f/2 is very readily detected by a blurring of the image.

A total of fourteen interchangeable lenses is available for the Contax, with focal lengths from 2.8 to 50 cm. All but the 2.8-cm., the 30-cm., and the 50-cm. lenses have focussing arrangements that couple automatically to the range-finder when the lens is slipped into the bayonet catch, giving a range of focal lengths from 3.5 cm. to 18 cm. with automatic focussing.

The Contax shutter is of the gear-braked focal-plane type, and has a metal blind. Speeds from $\frac{1}{2}$ to $\frac{1}{1,250}$ sec. are provided, and the shutter speeds are indicated, and may be set, either before or after winding. Delayed-action release, with a lag of about 12 seconds, is provided for self-portraiture. Winding the shutter automatically moves the film on and advances the counter, and the speed is set by rotation of the head of the same winding-knob, in the centre of which the shutter release is located. The combination of so many functions in one control contributes materially to keeping the camera free from a multiplicity of knobs. The release can be locked down by simply turning it; this has the dual effect of holding the shutter open if wound and set to "Bulb," and of enabling the film to be wound on continuously without setting the shutter.

For loading, the entire back of the camera takes off, allowing full access for cleaning to the whole path along which the film travels. Supplies of film for the camera can be obtained in three main forms; in the special Contax spool, in chargers of the kind standard for miniature cameras, or as bare film. The Contax spool consists of a core on which is wound a length of film terminated with opaque paper at each end, so that it can be loaded and unloaded in daylight without rewinding. Bare film, whether bought in ready-trimmed 36-exposure strips or in uncut lengths, must be loaded into the Contax cassette in the dark-room; the cassette can of course be put into the camera in daylight. Either in these cassettes, or the standard 36-exposure charger, the film must be rewound before being unloaded unless a cassette is used on the take-up side.

With a 5-cm. f/2 Sonnar, the Contax Model II cost £50 10s., but it may be had with a Tessar of aperture f/3.5 or f/2.8 at £40 10s. or £43 5s., or with an f/1.5 Sonnar at £65 15s. It may be obtained through any dealer, or from Messrs. Zeiss Ikon Ltd., of Maidstone House, 25-27, Berners Street, W.1.

Miniature Camera Gossip

By LANCELOT VINING.

MESSRS. S. MENDEL-SOHN, of

New York, write:

"We certainly would like to have the original of Miss June Taylor doing her aerial. Your signature on the print would enhance its importance to us as you are quite popular here, judging by the frequency with which our customers and friends tell us about your comments. . . . Your comment on the size of the Kalart and its being favoured by you for that reason is interesting to us, because we expect shortly to introduce a speed-gun which will be about half the size and have other interesting features not at present in the model you are using. . . . It will be considerably lower in price. We pass this news on to you, even before it has been released here. . . . Just as soon as one of the new speed-guns is ready, it will be rushed to you for trial and comment."

BALLET AT THE WESTMINSTER ICE CLUB. $\frac{1}{500}$ th sec. at f/2, I.S.S. film.

have very low roofs which bring the lights close to the ice surface compared with the other high arenas.

Exposures are best found by experiment, but the speed of the game calls for $\frac{1}{1000}$ th if the real incidents are to be illustrated. Try your $3\frac{3}{8}$ -in. lens if you have one, as I think you will like the size of figure it gives.

When it comes to skating exhibitions you will find that the professionals have the rink lights out and skate in the spots only, whilst the amateurs kill the effect of the spots by having the rink lights full on. The former method gives the best pictures.

Using the fastest pan. films, open up your lens, and when it comes to development try D.76 diluted 50 per cent.

Under the Arcs.

When the winter months and short days near at hand, I expect to renew my visits to the film studios. I find them intensely interesting, and there is always plenty to be learned from watching closely the way different types of sets and scenes are lit.

When the weather was at its worst this week, I wandered down to Pinewood and spent the day watching "Sailing Along" in the making.

I have never met a happier crowd on a set; Sonnie Hale was directing Jessie Matthews, Roland Young, Margaret Vyner, Alastair Sims and Peggy Novak, to name only a few of the stars on view.

Sonnie Hale came over directly I arrived, and told me he would fix up anything I wanted. I appreciated this, but I prefer to "snoop" about, as I find the interesting pictures are never the posed ones.

"HOLD THAT!" Sonnie Hale directing at the Pinewood Studios. $\frac{1}{500}$ th sec. at f/1.5, I.S.S. film.

It would seem I am famous at last!

Skating Rinks.

Ice-hockey and skating exhibitions are with us again. Last year, at about this time, I placed the London rinks in order from a lighting point of view, and up to the present I have found no reason to alter the order. Streatham comes first, then Richmond (no ice-hockey matches), then Haringay and Wembley equal, with Earl's Court last; the first two

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

Round the Town by Night By A. BEALES.

WAITING FOR THE SECOND HOUSE.
1 1/10th sec. at f/3.5, I.S.S. film.

BESIDES fireworks, and the illuminations that accompany them, the beginning of November brings the realisation that the season of bright sunlight really is over, and the photographer begins to turn his attention to the possibilities of work by artificial light.

Night photography is one of the special fields of the high-priced miniature with its ultra-rapid lens, but the combination of modern panchromatic films, which have tremendous sensitivity to artificial light, with the fairly fast lenses of the moderately-priced miniatures enables these less expensive cameras to undertake outdoor photography at night.

Limitations.

It is necessary, of course, to refrain from attempting impossibilities, and the restrictions imposed by the lens aperture and the shutter speeds of the camera must be remembered and observed. The photographs illustrating this article were all taken with a 16-on-V.P. camera costing less than £10, fitted with an f/3.5 lens and a shutter speeded from 1 to 1/300th second. A fast panchromatic film was used.

Care is needed in using an f/3.5 lens for night photography. Exposures of 1/10th sec. and 1/5th sec. are often necessary and need a steady hand. With the shutter working at these speeds I have found it possible to hold the camera in the hand, but it is no easy matter. The photo-

graph of the queue waiting outside the cinema was taken with the camera held in the hand, but a support was found for the one-second exposure given to the fountain.

All sorts of supports can be improvised in the streets—a wall, a ledge, a post or a pillar-box, etc. A tripod is best avoided, as its use in the streets is inconvenient if the streets are at all busy.

Focussing by Scale.

Next, there is the problem of focussing. My miniature does not possess the blessing of automatic focussing, so I resort to actually measuring distances where it is possible to do so, and to judgment of distances that are impossible to measure. Judgment of distance improves with practice; this I obtain by estimating distances of all kinds on my walks to work, etc. Thirdly, I always use a lens hood for night photography. I find it very useful for cutting out "dazzle" from unwanted naked lights.

Well-lighted areas, such as entrances to cinemas and theatres, shop windows, and opensquares all provide opportunities to photograph not only lights and buildings, but people also, in queues, at shop windows, waiting for buses, etc. Such photographs can be taken at 1/10th sec. with an f/3.5 lens and a fast panchromatic film.

Night photography certainly has a fascination in which users of "cheap" miniature cameras should be eager to share.

THE FOUNTAIN AT NIGHT.
1 sec. at f/3.5, I.S.S. film.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

ANGLE OF VIEW.

What is the meaning of degrees of angles as applied to lenses? For instance, the Leica lens of 5-cm. is quoted as "angle 48°" and that of 13.5-cm. focus as "angle 90°." These figures convey nothing to me.

R. L. P. (Croydon.)

The angle of view included by a lens on a given size of film is the angle obtained by drawing a line the length of the diagonal of the film, placing opposite to it a point at a distance equal to the focal length of the lens used, and then joining the ends of the line to the point.

You will see that the longer the focal length of the lens the narrower is the angle thus formed. In the case of the Leica lens of 13.5 cm. the angle is quoted by the makers as 19°. It is certainly not 90°, or anything like it; this figure would imply a lens of extremely wide angle and consequently very short focus.

UNSHARP NEGATIVES.

I enclose an enlargement from a miniature negative, taken at 1/100th sec., with the camera focussed on infinity. You will see it is not really sharp anywhere, even in the distance. Can you tell me the cause of this, and how the fault could be put right?

S. B. (Battersea.)

It is probable that the adjustment of the lens in the camera is not quite accurate, and we suggest that you send your camera, with the negative from which you made the enlargement sent, to a competent camera-repairer to have the necessary readjustment made. If the camera was bought new quite recently, we think you should allow the makers to have an opportunity of commenting on the results you are obtaining.

AN OLD MINIATURE.

I have recently acquired an Ernemann V.P. focal-plane camera, with Dognar lens, apertures f/4.5, f/6.3, f/9, f/12.5, f/18 and f/25. The mount is marked 1:4.5 F=75 mm. D.R.P. Can you tell me what these figures and letters mean? And do I double the exposure for each successive stop-number? How do these stops compare with f/8, f/11, etc?

W. L. (Northenden.)

"F=75 mm." means that the focal length of your lens is 75 mm., and "1:4.5" means that the maximum aperture is f/4.5. You are correct in thinking that you should double the exposure each time you go to the next smaller stop. You can get the relative exposures by squaring the f/ numbers. Thus the square of 8 is 64, and the square of 9 is 81, so that with f/9 you require about one-third more exposure than with f/8.

The letters "D.R.P." on your lens only indicate that its construction, or some point in connection with it, is the subject of a German patent.

GRAIN.

I enclose a print, which is actually from so small a part of a 3x4 cm. negative that the whole projected to an image about 15x12 in. The film was a fine-grain one of speed 26° Scheiner, and it was developed in D.76, but I still think the grain excessive. Could you give me your opinion?

A. F. R. (London.)

We do not think that the image is more grainy than can fairly be expected in the circumstances. You are probably aware that minimising the grain in such circumstances is a matter that requires some care, and much depends on the temperature and on the degree of development reached. You will certainly get less grain than in your present negatives if you use one of the special fine-grain developers in place of D.76, and you should not overlook the fact that brief development followed by printing on contrasty paper leads to less grain than more prolonged development followed by printing on a soft paper.

CINE LENS FOR ENLARGING.

I have the opportunity of buying a 3-in. lens, which is the right focal length for my purpose, enlarging from 6x6 cm. negatives. This lens was originally used for projecting cine film. Is it likely to give satisfactory definition for enlarging?

H. J. B. (London.)

It is practically certain that the lens will be quite unsuitable for the purpose you suggest as it is not intended to cover so large an area. The projected image of your film would be sharp and bright in the centre, but would be unsharp, and probably dim and poorly illuminated, towards the edges. The lens might even fail to project any image at all of the outer margins of your negatives.

THAT SETTLES IT!

Our advertising must, perforce, continue in the same style as heretofore, but with one or two slight changes and the addition of a section for the advancement of general miniature camera knowledge. Whatever our private opinion may have been, the great majority of letters received in answer to our recent appeal has left us in no doubt at all as to the opinion of our many friends and customers—which, Mrs. Micklestonehaugh, does not indicate that our customers are not our friends.

Those who asked for it will find their "hints" section already well under way, and this will, of course, be a regular weekly feature. Any miniaturist, having discovered something which he feels will interest his contemporaries, is invited to communicate it to us, and, if suitable, it will be printed with the usual acknowledgment to its author.

Incidentally, we are acceding to one or two requests to spare our enemies, so long as our enemies spare us, for 'bless 'em. We are told, also, that our reputation is by now so well and widely known that all the necessary trumpet-blowing is being done by our satisfied customers. We are, therefore, treading henceforth on the soft pedal, and our voice will be as that of the softly cooing dove. Which, as we have already remarked, settles all that. So, good sirs, may Providence guide and guard both you and us until next week, when our allegorical ship will break out her hook once again, and, sailing over a sunny sea, will finally bring up at "Try 202 for Service!"

"202"—THE "MINIATURE" MAN'S MECCA!

MINIATURE NEWS AND TIPS DEPARTMENT.

The space below will in future be dedicated weekly to tips and to news (sometimes, we hope, exclusive) of recent developments and forthcoming innovations in the world of the miniature camera. We ask our readers and customers to collaborate with us by sending along, for the benefit of their fellow miniaturists, information which they may have and which they consider should be brought into the limelight under this heading.

THIS WEEK'S NEWS.—Coming, a new Kodak single layer emulsion miniature film. Already for the last two months on sale in Germany under the name of EF, the new film has a speed of 23° Scheiner, and is said to give results of exceedingly fine grain combined with excellent latitude.

THIS WEEK'S TIP.—Agfacolor, in artificial light, is most suitable for brilliantly-lit scenes. Average exposure—neon signs in Piccadilly Circus, 10 secs., f/3.5. Shop windows, etc., between 10 and 100 secs. Yellow, green and blue come out well, but red rather dull. Improved with light blue Pan-ortho, or Optochrome filter. Messrs. Agfa at present experimenting with new filter (No. 69) said to give almost perfect results, and to be ready shortly for the English market.

A GUARANTEE,

when issued by a firm that prides itself on its straightforward and honourable dealing, gives a feeling of security to the purchaser that it would be difficult to put into words. All miniature apparatus sold by us is guaranteed against any defect whatever for one year from date of purchase, and indefinitely after the expiration of that period against any inherent defect. So, when buying your next camera, why not "Buy 'Lewis' and Buy Safe!"

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780.)

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

A Paillard-Bolex 16-mm. projector for £39:0:0

Do you know that you can get a Paillard super high power projector for 16-mm. films with **totally enclosed gear drive**, at the remarkably low price of £39:0:0?

This is a real "top notch" projector, similar in design and construction to the famous Paillard-Bolex G3, except that it shows only one film size, 16 mm. Here is your chance to have a model from the 1938 Paillard range, incorporating all the latest improvements, including choice of **two or four blade shutter** at the turn of a knob, giving flickerless pictures for home use, or maximum illumination for screens up to 16 ft. wide. Ask your dealer for details.

Specification includes: Enclosed gear drive, giving great precision and silent running, choice of two or four blade shutter at the turn of a knob. Still picture device, very efficient cooling, reverse projection, separate motor and lamp switch, etc. Price with 500-watt lamp and resistance **£39:0:0**

All type G Projectors are guaranteed to be adaptable without mechanical alteration to sound-on-film talkies by means of the Paillard sound head, which is being shortly introduced.

Write for details to Dept. A.P.:—

CINEX LTD., 70, High Holborn, London, W.C.1

ROBOT

"THE CAMERA THAT THINKS FOR YOU"

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position — no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and supersedes rangefinders.
- Takes up to 50 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 sec. to 1/500th sec. — and all intermediate speeds.
- Weighs 14 oz. — just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½ × 2½ × 2 in.
- Three viewfinders in one, including "right-angle" for "candid" work.
- Daylight-loading spools available.
- Camera has stainless steel body, covered black morocco.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

No. CDX.

Mr. P. B.
REDMAYNE.

"I COMMENCED photography about ten years ago, and at first used folding and reflex cameras, but for the past six years ninety per cent of my work has been done with a Leica, as I find this camera so convenient to handle and so economical to use. Processing a full reel of thirty-six pictures is infinitely less trouble than one film pack.

"I usually make use of Agfa F, because the speed is constant, and because the cassettes do not fog one or two pictures at the beginning of the reel, which is a common fault. I develop in Johnson's Fine-grain.

RYE.

P. B. Redmayne.

(From a bromoil transfer.)

For speed work I use Agfa I.S.S. or Kodak Super-X, developed in Atomal.

"I do not confine myself to any particular type of subject, but the majority of my exhibition pictures have either been child studies, genre subjects or studies of African life on the Gold Coast.

"After development each reel is strip printed and then filed. I subsequently experiment with a few of the pictures I like best; and for exhibitions I make either bromoil transfers or bromide enlargements. I regret that manufacturers do not give more attention to bromoil materials, particularly as it seems to be generally agreed that the papers to-day are not so satisfactory or so easy to work as those which were on the market five or ten years ago.

"Whereas I used to try to make many exhibition prints, I now experiment with perhaps half a dozen a year, and go in for quality rather than quantity. The storage problem alone after a few years makes this desirable. I always send a selection to an exhibition, for I find selectors and judges never agree with my opinion as to which are my best efforts.

"I regret that the tendency is for exhibitions to be composed almost entirely of 20x16 pictures, because this size requires very simple, poster-like treatment, and there are many subjects and processes which I think are best rendered in, say, 10x8 sizes, but pictures of this size rarely get good positions on the walls at exhibitions.

"Many writers have emphasised the importance of a perfect negative. To my mind this is much easier to make than to make the most out of it when enlarging.

"Personally, I believe the necessity for sunlight in pictures is over-rated. I am always struck by the number of photographers who insist on taking pictures in sunlight and printing them in sombre tones. If a photograph is taken in sunlight, it should be printed brightly. But there are many good pictures to be had on dull days; in fact I believe such studies are more inherently suitable for photographic reproduction, with its limited scale of tones, than bright sunlit scenes.

"Finally, I take *The Amateur Photographer* no less for its advertisements than for its articles."

(A further example of Mr. Redmayne's work is reproduced on one of the centre Art pages.)

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"HARMONY," by John H. Ahern.

PROVIDED it is adequately done, a simple subject always scores over one that is complicated. For one thing, a subject with a lot in it always takes a good deal of pulling together and almost invariably necessitates a certain amount of control, and, for another, a number of elements tends to obscure the pictorial motive.

With a picture in which the objects are limited, the intention is easily seen and its directness of statement usually lends it an appeal which is not only immediate, but one which is also inclined to stimulate a more sustained consideration, assuming, of course, that the theme is worthy.

And such, I think, is the case with "Harmony." Its simplicity is apparent. There are only the two ducks, a floating board, and a setting of water in various tones, the motive being an effect of light which is manifested in the reflections. Nothing could very well be more simple. The floating board is not very material, although it serves a purpose in breaking up the continuity of the ripples, and in so doing it lends interest to and diversifies the setting. It also, by means of the touches of light along its nearest edge, establishes a connection between the two principal elements of the subject material, the two birds in the upper reaches of the picture.

Of these, I would be inclined to regard the one near the centre line (1) as the chief, with the other (2) a close second. There does not, however, appear to be a great deal in it, for, while (1) has the stronger position, (2) is emphasised by the splash of adjacent light which affords a forceful contrast with its depth of tone. On the other hand (1) is somewhat stressed by the imitation provided by its reflection; but, whether the point regarding priority be conceded or not, there is little doubt but that the two together make an exceedingly effective group, and one

which dominates the picture in no uncertain fashion.

But these two objects, placed as they are, are in opposition to one another and need another element to introduce a sense of balance into the composition. The line of light previously referred to does soften the feeling of opposition, it is true, but more is needed to round off the arrangement and make it complete.

for that, although it is quite effective as a balance and admirably completes the composition, but, as well as this, it confers a sense of form.

That form is an inverted pyramid. Between (1) and (2) the touches of light almost make an actual line, and, with the introduction of (3) interconnecting lines are suggested between the two former and the latter, somewhat

helped by one or two touches of light that occur between the extremes, as well as by the directional impulse suggested by the inclination of the reflection of (1). The formation is indicated in the accompanying sketch by dotted lines, and its strength and power of unifying the arrangement may be gathered therefrom. Incidentally, it may be mentioned that the inversion of the form does not involve any but a minor loss of strength, and all that that amounts to simply arises from the fact that, with the transference of the baseline, the feeling of stability is not enforced as it is when the formation is turned up the other way.

Stability, in this instance, is established by the greater weight of tone in the lower portion of the picture, and the emphasis which the pyramidal formation might have conferred is not needed. In the inversion, however, it not only unifies the arrangement, but brings out the effect of light as the pictorial motive,

besides which it is largely responsible for the impression of adequacy which the subject, despite its simplicity, manages to convey.

But we are also forced to the conclusion that the attainment of simplicity in a picture is not so simple as it might seem. It is easy enough to restrict the material, no doubt, but in order that it may tell effectively, it must be properly and intelligently designed, as it has been in "Harmony," and, with this very successful and satisfying example in mind, the method by which it can be done is indicated.

"MENTOR."

The two birds are in the upper portion of the picture, and, that being so, the natural place for the balancing accent must be in the lower. In this instance, the function is fulfilled by the patch of light in the neighbourhood of (3), but, were it not for the fact that this light, in conjunction with the smaller touches above, establishes the motive, almost anything—a smaller bird, a bit of floating wood or debris, or perhaps a water-lily—would do, provided, of course, it did not prove so assertive as to upset the priority of the group above. The point of light in question is not forceful enough

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

IN dealing with "Pictures in the Making" this week, I have discussed the value of simplicity, chiefly from the angle of arrangement and choice of material, but there is another aspect of simplicity, which is suggested by No. 1 of the prints reproduced on the opposite page—"Rain, Margate," by A. Trowbridge—and that is simplicity of tone.

Scale and Key.

Not that there was anything wrong with the scale of tone employed in "Harmony," but it did not deviate from the normal sufficiently to provide an occasion for comment.

No. 1, however, is treated in rather a high key; it has no darks of any significance, and, as a whole, it is composed of delicate shades of half-tone. It is as simple in its tonal scheme as the other was in its limitation of material.

Nevertheless, there is no lack of quality, nor, as far as this aspect is concerned, does the rendering seem lacking in strength. Moreover, there are comparatively large amounts of even, or nearly even, tone—the foreground and sky for example—which also contribute towards the impression of simplicity. In point of fact, I should say that they count as much as the delicacy of key; but, be that as it may, the uncomplicated nature of the tonal scheme is very valuable in enabling a feeling of luminosity—arising from the light in the sky—to be suitably conveyed.

That effect might be taken to be the pictorial motive and it is quite well expressed, but, in choice of subject material, the scope of the scene is rather too wide and the theme would get across just as well if half an inch were trimmed from each side, together with a quarter of an inch from the base.

Near and Far.

Trimming the print enables it to acquire just a bit more concentration and does not adversely affect the simplicity of the tonal scheme. No. 2, "When Day is Done," by D. J. McEwen, is of a different character, most of the subject matter being close at hand. A greater degree of contrast is therefore desirable, for things near at hand are, as a rule, seen in stronger tone than those at a distance.

But I do not think that so great a weight of tone is necessary as has been employed in this instance, for the figure, and most of the boat, are little removed from solid black. Compared with No. 1, the tones are harsh and uncompromising, and, putting it quite bluntly, the print has been made upon the wrong type of paper. It is much too vigorous and the only thing that is likely to afford any improvement is to reprint on another and softer grade.

It may be, perhaps, that under-exposure is a contributing cause, and, if so, the softer paper can do no more than mitigate the contrast. It could not be expected to provide modulation that did not exist in the negative; but, in the absence of the latter, it is impossible to say whether under-exposure be present or not.

Relative Exposures.

The difference between these two prints, however, brings home to us the need for increasing the exposure as the subject comes nearer. Given equal general illumination, a subject like No. 2 might easily need ten or fifteen times an exposure that would be enough for No. 1, and in view of the fact that No. 2 is seen against the light, more might possibly be required. There is no doubt, however, that it is definitely a subject that would be best rendered by a fast panchromatic film.

With No. 3, "A Halt by the Wayside," by June N. Smith, there is no visible evidence of a scanty exposure, and the presence of quite a measure of half-tone in the foreground seems to indicate an adequate allowance, but the absence of tone in the sky, particularly in the upper reaches, makes the impression seem rather bald and over-aggressive. If there had been a depth equivalent to the tone of No. 1, the suggestion would not be so apparent, and, to overcome the drawback, I would be inclined to suggest a gradual over-printing towards the top from just above the van.

Due allowance for the proximity of the subject also seems to have been made in the case of No. 4, "The Gossips," by M. Copnall, and the print contrast seems just about right. The figures, too, are very well caught, although I should have liked to see a

somewhat greater space between the one on the left and the wall of the arch, which almost seems to intervene.

Excluding the Sky.

That bit of bright tone at the top where the sky appears is inclined to draw the attention away from the figures, and, here again, I should try and lower it by means of local control.

No. 5, "Into the Shade," by D. W. Watson, surmounts the difficulty by excluding the sky altogether, and, in consequence, there is nothing to impair the interest of the group. The figures, however, are very near, and again are seen against the light. The probability is that some allowance has been made, for they are not without a measure of gradation in their darker tones, but the features are barely visible, and if it be desired to show them in fuller detail, the exposure given should have been very appreciably increased.

Something like eight to twelve times that given would be required, but, if the subject be retaken, I should recommend a greater viewing distance—a couple of yards would be enough—in order that the scale of the figures might also be reduced. The expedient would scarcely affect the exposure required, but it would provide a more spacious setting and avoid the present feeling of restriction.

Space and the Setting.

A similar sense of restriction arises in the case of No. 6, "Sun and Shadows," by Charles Baker, and a greater margin all round seems advisable, i.e., if it could possibly be obtained.

The suggestion of the title is well borne out in the print, nevertheless; although, had there been another shadow thrown right across the immediate foreground, leaving just a gleam between it and the shadow of the cart, the force with which the sunlight is depicted would have been enormously enhanced.

The probability of getting such a shadow, however, would seem to be extremely remote, for there is nothing in the print to provide an indication of anything of the sort, but the point is mentioned because the effect of an introduction of this nature would be profound—as may be imagined if it can be visualised. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

PRINTS THAT ARE WORTH WHILE.

IN a provincial photographic magazine I have just read an extraordinary article entitled "Much Labour Lost, or the Exhibition Print." As far as I can understand it—which is not far—it holds up to ridicule and *dérision* all photography except the *ciné* variety. "The still photograph should only be permitted to exist as a relic of a past age," begins the author. "In a landscape," says he, "the tree is still, the clouds immobile, the torrent frozen, the cow's tail motionless, and the offending fly for ever transfixed." And then he goes on to describe the difference when the *ciné* film gives movement. Almost without alteration I can make some of his statements into a verse.

The torrent rushes madly on,
The clouds go rolling by,
And the cow is mad with frenzy
At the teasings of the fly.

What the author wants is movement, which he describes

ON THE COMMON.

Edgar Mills.

THE MILL POOL.

C. E. Blake.

as the essence of life. Consequently, I presume, there is no beauty in photographs, paintings and drawings, in sculpture, in architecture, because they don't "work." A Punch and Judy show is preferable to Rheims Cathedral, and the clock-work "Sleeping Beauty" at Madame Tussaud's to the Venus de Milo before she met with her accidents.

I have borrowed from a Beginners' Competition four prints which must be regarded only as relics of a past age, because they ought to show movement—and don't. The sheep on the common should wobble their tails, and the clouds should set sail. The ducks on the pool should duck, and the reflections wiggle-waggle. Anton Lang should show us a close-up of his teeth. The hikers should hike, and the blacksmith should exercise the muscles of his brawny arms and wave his large and sinewy hands.

Personally, I find these four prints, and thousands of others, satisfying and delightful. I am thankful that they keep still while I admire their restfulness and beauty. The labour spent on them was not lost, but amply rewarded. They are worth while.

I do not intend to retaliate on the author quoted by condemning all *ciné* films simply because so many are jerky, scrappy, puerile in conception, and horrible in execution. A film can be, and often is, a thing of great beauty and interest. Movement, action, and even sound and colour, are indispensable in certain circumstances.

ANTON LANG.

G. R. Webb.

But to me it seems childish to say that there can be no beauty or interest in the "still" photograph. Surely there is such a thing as imagination. Surely even the four prints here are more to us than spots of printer's ink on paper. I can hardly imagine the beginner ceasing to try to produce such prints merely because they do not move. Who wants them to move?

Many prints made by beginners (and others) are of course limited in their interest; but that does not mean that they are not worth making. I think it is worth while making a

THE BLACKSMITH.

I. G. Dewinter.

print even if it has interest for a single person only. All we need do is to avoid bothering other people to look at them. But such a print as "On the Common" has a wide appeal. Sunsets are very old-fashioned, like, say, love and music; subjects of this kind have been drawn, painted and photographed these many moons; and nothing in the print moves. Yet I like it; and I like the other subjects, too; and I think that they are the kind of thing we should look for and photograph whenever we get the chance; and they are not so rare either.

On the other hand, we might be moving in the right direction if we made a photograph of a church, and put a miniature clock in the tower so that we could see the hands move. I feel that even more could be done with photographs of a cow and a fly; but we had better leave them to the film people.

W. L. F. W.

Amateur Dry Mounting

MANY amateurs who do their own enlarging, and who require their prints to be dry mounted, hand this work over to the professional, believing that successful dry mounting can only be done with the help of a mounting press, an expensive and heavy accessory of the professional worker. Whilst such a press is a great convenience, it is seldom realised that an ordinary domestic electric iron can carry out this work quite successfully, if a few precautions are observed.

The most important point, upon which success depends, is the temperature of the iron, which must be neither too hot nor too cold. The correct working temperature is 170 degrees Fahr., and this can be gauged quite accurately by means of any mercury thermometer which registers up to 200 degrees or thereabouts. The bulb is pressed against the hot base of the iron, being moved from one end to the other, and the mercury will rapidly register the correct temperature of the metal. When this has been reached the current is switched

off, for the iron will retain its heat for a fair period. It is necessary, of course, to use an unmounted thermometer, otherwise it is impossible to bring the bulb in contact with the metal.

Mounting tissue can be bought, most economically, in large sheets, and a piece is cut off the same size as the print to be mounted (which, at this stage, is untrimmed). The print is then turned face down on some firm support (a drawing-board is ideal) and the tissue placed exactly over it. Taking care that there is no displacement, the tissue is touched in the centre with the toe of the hot iron, when the tissue immediately fuses to the print at this point.

The print is then turned over and trimmed to the required size, together with the tissue. To ensure that no "edging" of the tissue shows after the print is mounted, and this is frequently an objectionable feature with dry-mounted prints, the print and the tissue should be "undercut" with a sharp trimming knife. The mount on which the print is required to be fixed is then

placed on the support, face up, and the trimmed print adjusted to the exact position required. If a corner of the print is turned up while it is held in position and the tissue is then made to adhere to the mount at one spot with a touch of the hot iron, it will not shift when the complete mounting is undertaken. A clean piece of thin paper is now placed over the print and the final mounting proceeded with. To do this the hot iron is then taken and pressed very firmly on the print, starting at one end and moving slowly across the print with a deliberate action and considerable pressure. No harm will result through going over the print more than once, and a firmly and cleanly mounted print should result.

Should it be found that the tissue sticks to the mount but not to the print, the iron has been too hot; and if, on the other hand, the tissue sticks only to the print and not to the mount, the iron has not been hot enough, or the pressing has been insufficient, or too hurried.

C. T. WOOLLEY.

MAKING BETTER SNAPSHOTS-22

By DAVID CHARLES.

This article is the twenty-second of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. The fine distant lines against a white sky tend to disappear when normal exposure is made for the landscape.

Fig. 2. A short exposure reproduces the sky exceptionally well, and silhouettes the lines against it.

Fig. 3. Tilting the camera up from a nearer viewpoint produces an effect rather popular to-day.

SOME people profess a horror of pylons. To me, and I feel sure to many more, they have considerable fascination. The tendency of this age is towards the construction of buildings and of mechanical devices which shall be the acme of efficiency for the particular purpose of each. An aeroplane must be just that. It has not an ounce to spare for carrying "ornament," and as the flying machine increases in its efficiency, so it evolves from the ugliness of its early makeshift to undeniable beauty. The simplicity of a pylon is just one more example of an apparently simple steel construction built to withstand strains the immensity of which only the designer can really appreciate.

If one can delight in photography of primitive and decidedly inefficient cottages, ancient bridges and castle keeps, it seems illogical to rule out as "inartistic" a super-efficient device because it was built but yesterday! So let us defy false snobbery, and at the risk of being termed Philistines (which breaks no bones) set out to see what can be done photographically with a pylon.

Autumn Clouds.

At any rate this is just the right time of year for the experiment. For one thing there are so many days to give us that background of clouds against which the steel criss-cross looks all the more fascinating. For another reason the fear of under-exposure which prevents us from attempting so many other tempting subjects will now help us to get a pleasing effect. For what is the usual trouble when a glorious cloud effect surmounts

the more usual types of subject? Simply that in exposing for the subject the sky is inevitably over-exposed, and so "flattens out." The exposure which reproduces clouds at their best (filter or no filter) will under-expose the main subject and destroy its detail. But here we have a subject which is only black lines anyway, and so need not fear under-exposure.

A Fully-exposed Rendering.

At the top is a photograph taken one

early morning in summer with all the trees and weeds in full leaf. It was just a fancy of mine to contrast the untidiness of the foreground with the prim stateliness of the pylon beyond. A slight haze plus a little lack in depth of focus has caused the sky, in making the full exposure required for near-to weeds, partly to swamp the fine lines of steel.

The second view shows the same pylon (from a different spot) much later in the year. The short exposure has abolished all detail in the foreground,

but does one care for that? Would the picture be improved by "normal" exposure and a softer, lighter sky? I venture to think no one would suggest it. Now there are many kinds of pylon and many other types of structure which would look equally majestic against such skies as are prevalent nowadays. So those whose cameras are not designed for speed work on dull days can still find plenty on which to exercise their skill.

Choice of Films.

Of course it is well known that panchromatic film is the best for rendering clouds against a blue sky. But when, as here, there is no blue, but only varying shades of grey, those to whom the rather ugly word panchromatic still holds an element of mystery and fear need not worry. The "fast 'chrome" type of film, at one-and-twopence the No. 20 spool, will give them what they want.

Fig. 4. Laying the camera centrally, lens upwards, on the ground, a small stop produces this interesting pattern.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Making Enlargements from Sub-Standard Films

By H. A. ROBINSON.

THE making of good enlargements from single frames of sub-standard film (particularly 9.5-mm.) is by no means easy, unless the frame and other conditions are particularly good. But if the greatest care in selection and working is taken, such enlargements are feasible and quite satisfactory results can be obtained.

The factors tending to militate against the easy making of enlarged prints are:

1. Lack of sharpness.
2. Grain, structure or blemishes.
3. Unsuitable gradation.
4. The necessity of "over-enlargement" if a decent-sized print is to be secured.

Where Projection Scores.

None of these factors prevents good screen projection, since flaws, blemishes, etc., do not appear in the same position on successive frames and so are not detected by the eye. However, no such remedial effect can be relied on when making single enlargements on paper.

The first thing to bear in mind is that it is quite impossible to obtain satisfactory results if the definition of the frame in question is poor, so in selecting frames choose only those that are perfectly sharp and to this end examine each through a fairly high powered microscope. Grain cannot be dealt with at this juncture, but in selecting frames be very careful to avoid any possessing even the most minute flaw in structure or other blemish.

With regard to gradation, too "hard" and contrasty frames are not good, the best being those which, through suitability of lighting and subject, are full of detail and half-tones with no very dense or too transparent parts.

As you are in most probability working from a positive film, a negative must, of course, be made first.

Alternative Methods.

This can either be (a) an enlarged negative (made by placing the positive frame in the enlarger and projecting on to a suitable sensitive material of the desired size) from which contact prints are taken, or (b) a "size for size" negative obtained by contact with the positive, and from which an enlargement can be projected in the usual manner.

Any fine-grained developer should be used in making the negatives, but scrupulous cleanliness must be observed and care must be taken with the exposures. Modification in gradation can be effected within certain limits at this

stage; thus rather hard positives can be coaxed to yield softer negatives by giving a fairly generous exposure and curtailing the time of development, while if the original is soft the development of the negative will have to be prolonged. In this case the exposure should be kept down to the minimum or the resulting negative will be rather on the dense side, making long exposures necessary when printing or enlarging from it.

Choice of Process.

The enlarged negative method or size for size method can both give good results, and which is employed is greatly a matter of personal preference, but it should be noted that in the latter method so little film is used that a number of exposures can be made, and the best used. A very little difference in exposure often makes a great difference in result. Thus supposing that about two seconds was found correct, then it would be no harm to try one, a short two, a long two, and even three seconds. Upon development one negative will be found generally outstandingly better than the others.

The enlarged negative lends itself easier to modification—and also handwork—before making the contact prints.

To prevent grain and structure showing too much in the final print (given as it is through the enlarger) use a condenserless type of lantern. Give a generous exposure rather than otherwise, as this will tend further to cut out grain. Under-exposing and forcing are fatal. Rather a somewhat flat print than one with a bad attack of measles. In all cases use matt paper.

The Final Touch.

Now for the last step—spotting the print. This is a big point, and its remedial effect, if carefully done, cannot be over-estimated. The "tightening-up" effect resulting from careful application of the brush is truly remarkable.

If you have artistic ability a little more work can be put in, strengthening shadows, etc., but this should not be attempted unless you have the skill necessary to do the work really well. Although properly-applied hand-work can sometimes be the making of a print, hand-work that shows as such is always fatal to success.

Rough sea pictures of this type are now possible at frequent intervals all round the coast. They make striking ciné shots, especially if a strong foreground is included as in the above.

Screens for Lantern and Ciné Projection

THE projectors reviewed in the Ciné and Lantern Number last week, all alike require a screen upon which to show the picture. At one time a plain white sheet was considered adequate for all purposes, but the need for brighter pictures, especially in connection with the projection of 9.5-mm. and 8-mm. ciné films, has led to the production of screens of high reflecting power.

Where light is plentiful, the simple white screen remains unsurpassed, owing to its non-directional reflection, but where the need for making the most of the available light is felt, either a silver-surfaced or glass-beaded screen is preferred for its much higher efficiency. In the following paragraphs screens are divided into these three classes, and prices, sizes and sources of a number of screens of each type are given. Names of manufacturers or agents follow each entry; for their addresses reference should be made to the advertisement pages of this issue.

Opaque White Screens

V.I.S. CALICO SCREEN.

Plain calico screen, with eyelets or tapes for hanging. Sizes, 5×4 to 8×6 ft. Prices 13s. to 19s.

V.I.S. Projectors.

OPTISCOPE HOME SCREEN.

White fabric screen with opaque surface, mounted on rollers for storage. Has side stretchers to hold it stiff when erected. Arranged to stand or hang. Size 52×52 in. Price £2 5s.

Ensign Ltd.

ENSIGN OPAQUE SCREEN.

Opaque white canvas, on rollers, with cords and pulleys for rolling and unrolling. Can also be supplied with box into which it rolls away, this box to be fixed to wall or ceiling.

Sizes from 6 ft. to 12 ft. square. Prices from £2 12s. 6d. to £7 15s. without box, or £3 15s. to £9 10s. with box.

Ensign Ltd.

NEWTON CLOTH SCREEN.

Opaque cloth screen, painted white, complete with cords and pulleys. Sizes, 6×6, 8×8, and 10×10 ft. Prices £2 15s. to £5 10s.

Newton & Co.

NEWTON OPAQUE SCREEN

White opaque screen on spring roller, in box with side supports. Will stand without support at top. Sizes, 4 ft. to 8 ft. square. Prices £4 18s. to £8 15s.

Newton & Co.

Silver Screens

V.I.S. SILVER SCREEN.

Roller screen with straps and carrying handle. Stretchers extra if required. There is also a self-erecting model in case with carrying handle.

Sizes from 32×24 to 63×48 in. Prices, 10/- to £1 18s. 6d. Self-erecting model 32×24 and 40×30 in. Prices £3 and £3 10s.

V.I.S. Projectors.

KODASCOPE ROLLER SCREEN.

Silvered screen on fabric base, rolling up on wooden rollers. Fitted with side stretchers to hold screen flat. Sizes, 22×16 to 40×30 in. Prices 10s. to £1.

Kodak Ltd.

C.T. SILVER SCREEN.

Rollable screen, with rollers, batten and side stretchers. Sizes 18×12 in. to 72×54 in. Prices 10s. 6d. to £1 10s.

Cinema Traders Ltd.

ROLLER SCREEN, SERIES 102/113.

Rollable screen for hanging on wall, with side stretchers (as extra) if required for additional rigidity. Sizes, 24×20 in. to 102×70 in. Prices 15s. to £6 17s. 6d. Stretchers extra, 5s. 6d. to 12s. 6d. per set.

R. F. Hunter Ltd.

K.P. ROLLER SCREEN.

Silvered roller screen with side stretchers to ensure an even surface. Sizes, 36×30 to 60×48 in. Prices £1 5s. to £1 15s.

Pathscope Ltd.

SILVETTE RIGID SCREEN.

Rigid wooden screen with feet enabling it to be stood anywhere. Sizes, 24×18 to 40×30 in. Prices £1 7s. 6d. to £2 7s. 6d.

R. F. Hunter Ltd.

HILBERT PROJECTION SCREEN, TYPE I.

Rigid screen with special surface coated on unwarpable wood base, with metal protecting corners. Can be stood or hung. Sizes, 25×20 to 52×40 in. Prices, £1 10s. to £3 15s.

Sands Hunter Ltd.

PATHSCOPE SILVER SCREEN.

Silvered canvas on wooden rollers.

For picture 36×30 in. Price £1 10s., or with stretchers and stand, £2 12s. 6d.

Pathscope Ltd.

SELF-RECTA SCREEN.

Automatic-opening screen requiring only to be pulled out of containing box for use; needs no top support. Sizes, 27×20 to 52×40 in. Prices £2 5s. to £4.

R. F. Hunter Ltd.

PATHSCOPE FOLDING SCREEN.

Strong silvered canvas on rollers, with stretchers and stand. Size 55×39 in. Price £2 17s. 6d.

Pathscope Ltd.

HILBERT PROJECTION SCREEN, TYPE II.

Roller screen with the same special reflecting surface used for the Type I screen. Sizes, 40×30 to 80×60 in. Prices, £3 2s. 6d. to £8 2s. 6d.

Sands Hunter Ltd.

CELFIX SCREEN.

Portable self-erecting screen which automatically springs up into position when catch on carrying-case is released. Sizes from 27×20 to 96×72 in. Prices, from £3 10s. to £24.

R. F. Hunter Ltd.

PATHSCOPE LARGE SILVER SCREEN.

Silvered canvas screen on wooden rollers with side stretchers to hold it flat. Size 8×6 ft. Price £6 10s.

Pathscope Ltd.

Glass Beaded Screens

KEELITE EASEL SCREEN.

Rollable screen that can be hung on wall or stood on an easel. Sizes, 22×30 and 30×40 in. Prices, complete with easel, £1 5s. and £1 19s.

R. E. Schneider.

PATHSCOPE BEADED SCREEN.

Roller-type beaded screen with side

stretchers. Sizes from 36×30 to 60×48 in. Prices, £1 15s. to £4.

Pathscope Ltd.

SILVETTE RIGID SCREEN.

Rigid wooden screen with feet allowing it to be stood anywhere. Sizes, 24×18 to 40×30 in. Prices, £2 7s. 6d. to £4.

R. F. Hunter Ltd.

V.I.S. BEADED SCREEN.

Roller screen with straps and carrying handle. Stretchers are available if required. There is also a self-erecting model that packs away into a case. Sizes, roller type, from 40×30 to 63×48 in. Prices from £2 10s. to £6. Self-erecting models, sizes 32×24 and 40×30 in., £4 and £5.

V.I.S. Projectors.

CELFIX SCREEN.

Portable self-erecting screen automatically springing up into position for use when released from carrying-case, which also forms stand. Sizes, 27×20 to 96×72 in. Prices, £4 10s. to £30.

R. F. Hunter Ltd.

KEELITE BEADED SCREEN.

Semi-automatic quick-erecting screen which rolls up into tube mounted on tripod stand adjustable in height over wide range. Screen is merely pulled out of tube, when it stands flat and rigid. Picture sizes, 30×40 to 42×56 in. Prices from £4 17s. 6d. to £7 17s. 6d. complete with stand.

R. E. Schneider.

ATLANTA SCREEN.

Roller screen which is rolled into box, fixed to wall or ceiling, by pulley device. Sizes from 80×80 in. to 13×10 ft. Prices from £20 to £48.

R. F. Hunter Ltd.

SUPER CELFIX SCREEN.

Extra large beaded screen in case which also forms base for standing. Is wound into position by handle on a detachable upright. Sizes from 9×7 to 13×10 ft.; prices from £36 to £60.

R. F. Hunter Ltd.

A Remarkable Amateur Ciné Theatre

WE have recently had the opportunity of visiting what must be one of the most complete and efficiently contrived miniature ciné theatres yet built and equipped by an amateur. To carry out, personally, all the details of construction entailed in this production connotes not only mechanical and technical ability, but considerable enthusiasm, and these qualities the amateur in question, Mr. F. W. Bontor, evidently possesses in a marked degree. The theatre has been built in the long and high attic roof of his house in S.W. London. In the space at his disposal, in addition to the screen and proscenium, comfortable seating accommodation for over a score of people, at a good sighting distance from the screen, has been provided. The operating chamber containing the projector, and all light and sound controls, is entirely cut off from the auditorium, and beyond this again is a dark-room, which contains all that is necessary for the practical side of the production. It is ideally fitted to cope with every problem of ciné and miniature camera work.

In the little theatre itself an illusion of the size of the stage and proscenium, etc., is sustained by the appearance from below the stage level of what is

apparently a regular ciné organ, complete with organist. This is, of course, in miniature, and when it quietly rises into position the illusion is complete. An admirable musical number is given, during which a variety of coloured lighting effects come and go across the curtains shielding the screen. The organ and organist then sink from sight in the approved manner, and the curtains slowly open.

On the occasion of our visit an admirable programme of travel pictures taken in the West Indies and South America was projected, with a running commentary by the author, all of which, of course, came from the loud-speaker on the stage. The films were in full colour, and were the best collection of Kodachrome films we have seen recently. At the conclusion of the performance, the musical accompaniment that was being continued softly as a background, gained strength and the dimmed lights were turned on again—a most satisfactory display.

An investigation of the projection room showed an amazing number of gadgets, all perfectly arranged to control every phase of lighting and effect that one associates usually with the full-sized cinema. The music and sound were produced by a specially fitted

gramophone beneath the projector and, in addition, a microphone by the side of a sighting aperture enables a commentary to be given while the films are being projected and observed. The apparatus controlling the alteration of lights on the curtains, the coloured lights on the screen, and various other refinements, were entirely home-made and Meccano parts and three-ply played a large part in their construction. In addition, the theatre contained an air-conditioning apparatus to keep the room at a constant temperature.

The floors of the entire apartment, dark-room and approach lobby were all rubber-covered, and in every detail one realised the desire for perfection that actuated Mr. Bontor in his hobby. He is to be congratulated on his work, and he extends an invitation to any reader of this paper who is actually interested in a similar production. Needless to say, he is anxious that those who are merely actuated by curiosity or who just wish to see a display of films should not apply. He is seriously concerned with his work as an amateur, as it is one well within the reach of any other keen amateur cinematographer. Any applications to view this little ciné theatre should be sent care of The Editor of *The Amateur Photographer*.

Firework Photography for the Cinematographer

THE cinematographer will find an abundance of suitable material for filming at firework displays on "Guy Fawkes" night, and on other occasions at this time of year. Good motion pictures of fireworks are incredibly realistic in effect when projected on the screen. The technique in filming this type of subject must of necessity be different from that employed in taking "stills," since time exposures cannot be employed. The great difficulty is to procure sufficient exposure, but the large-aperture lenses obtainable even in moderately priced ciné cameras counter-balance this difficulty to a certain extent.

In general, satisfactory pictures can be obtained on fast panchromatic film,

using an aperture of $f/3.5$, with the camera running at half-speed (8 frames per second). This half-speed motion is doubly advantageous; in the first place it makes it possible to double the exposure for any given lens aperture, and, secondly, such a film when projected normally will naturally cause the fireworks to go through their evolutions at double speed, which greatly enhances the effect, and incidentally the progressive movement of the bright lines of the firework is better rendered.

If your camera has not variable speed, a larger stop than $f/3.5$ will generally be necessary, although the brilliant magnesium fireworks which give an intense white light will often give a good result at this aperture.

A method of photographing these displays that can be attempted by those who possess a ciné camera embodying an easy rewind mechanism is to expose the same length of film over again or several times at each following burst of rockets or other fireworks. The camera—on a tripod—remains in exactly the same position, particularly if there is some strong foreground object. The repeated exposures on the same film will then give the effect of a much greater show of fireworks, similar to that secured by the still camera exposed for a series on the same plate. R. W. N.

(Many of the points in the article on "Firework Photography" elsewhere in this issue can be applied to ciné work.—Ed.)

Exhibitions and Competitions CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars:

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, November 30. Rules in the issue of October 27.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Folkestone C.C. Exhibition of Photography.—Open, October 23–December 4. (A. J. Stewart, 25, Guildhall Street, Folkestone.)

Sixth Irish Salon of Photography.—Open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

Fourth Canadian International Salon of Photographic Art.—Open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

G.E.C. (Coventry) P.S. 4th Annual Exhibition.—Open, November 8–13. (C. W. Crowe, G.E.C. (Coventry) Photographic Society, General Electric Co., Ltd., Coventry.)

International Salon Oval Table Society, Inc.—

Open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

XIe International Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Brederodestr. 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Aberdeen P.A. International Exhibition of Photographic Art.—Entries, January 15, 1938; open, February 5–26. (Miss Hilda N. Bailey, 63, Watson Street, Aberdeen.)

Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7–12. (T. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—

February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31; open, March 7–12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)

City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday, February 7; open, March 7–12, 1938. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April, 1938. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

Scottish Photographic Federation 30th Scottish National Salon.—Entries, March 2; open, April 2–16. (Percy H. Cartwright, 52, High Street, Galashiels, Scotland.)

The Diafant Model I projector for miniature slides is a neat and workmanlike little instrument suited for the projection of colour transparencies as well as of slides in monochrome. The body is finished in black crackle enamel, and is very well ventilated. It contains a holder, with mirror reflector, for a 110-volt 250-watt tubular projection lamp of the pre-set focussing type, carried on a strong stirrup support that is fitted for lateral adjustment over the small range necessary. Between this lamp and the condenser is fitted a thick glass heat-resisting screen the back of which is freely accessible for cleaning. By removing four screws the entire front, carrying condenser, slide-carrier, and lens can be detached, enabling the front of the heat filter and the back of the condenser to be reached, while by undoing four bolts that hold the two halves of the slide-carrier together the whole of the rest of the optical system is exposed. The projector is normally equipped with a neat, quick-change carrier for slides 2×2 in., but this can be replaced by a special carrier for film positives in strip form which is available at an extra cost of only 15s. The lens

is fitted with a Parastigmat lens of aperture $f/4.5$, will throw an adequately illuminated monochrome picture up to 4 ft. 6 in. \times 3 ft. This model sells at £8 15s., resistance for voltages over 100 £1 12s. 6d. extra. Both projectors are obtainable from the sole British agents, Messrs. Sands Hunter & Co. Ltd., 37, Bedford Street, Strand, W.C.2.

up to 9×6 ft. from the usual 24×36 mm. transparency. Equipped for 110-volt mains, the projector costs £12 15s. without lamp, and a resistance enabling it to be used on mains of any voltage is available for £1 17s. 6d. The Diafant Model O, which uses a 100-watt lamp and

The 30th Scottish National Salon will be held in the Scottish Woollen Technical College, Galashiels, from Saturday, April 2nd to Saturday, April 16th, 1938. There are four sections: A, prints, confined to photographers resident in Scotland and to Scotsmen resident outside Scotland; B, prints, open to all workers; C, lantern slides, open to all workers; D, prints or slides of scientific or record interest, open to all workers. Entries must reach the Hon. Salon Secretary, Mr. Percy H. Cartwright, 52, High Street, Galashiels, by March 2nd, 1938, or the last day for receiving pictures at the gallery is March 9th, 1938. The entry forms are now ready and may be obtained by making application to the Hon. Salon Secretary at the address given above.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Nearly all the photographic societies in Great Britain have now resumed work in earnest for the winter, and we have been asked by the Secretary of the Liverpool Amateur Photographic Association, Mr. E. H. Austin, 14, Bluecoat Chambers, School Lane, Liverpool, to announce that he will be pleased to supply information regarding this society to any amateurs in Liverpool who are interested and wishing to derive the benefit of club membership.

The Hon. Secretary of the Polytechnic Photographic Society, 309, Regent Street, W.1, informs us that the club has now started its winter season with greatly increased facilities and is in a position to consider applications for membership. Two developing rooms, a printing room, two enlarging rooms, fitted with seven vertical enlargers and a Leica Focomat enlarger, are available for the use of members, in addition to the lecture room, which is fitted with lights for "still life," etc. Full details can be obtained from the Hon. Secretary, Mr. D. A. Feldman, 30, Ashworth Road, Maida Vale, W.9.

By an unfortunate error the name of the agents for the Ampro projectors for 16-mm. silent and sound film was incorrectly given in the reviews of projectors in last week's issue. Although they can be obtained from the firm mentioned, the actual importers of these instruments are Messrs. M. W. Dunscombe, Ltd., of 5, St. Augustine's Parade, Bristol, to whom all enquiries should be made, and we would ask readers who are keeping the Ciné and Lantern Number for reference to make the necessary correction.

It is with great regret we have to record the death of Mr. Walter Clutterbuck of Marsham Hall, Norwich. Mr. Clutterbuck was one of the older school of pictorial photographers, and his gum-bichromate prints were, in the past, well known at all the leading exhibitions. He exhibited at the old "Linked Ring" shows and was a member of the London Salon of Photography.

The Carlisle Camera Club, formerly the Carlisle and County Amateur Photographic Society, has now moved to new premises at 6, Finkle Street, Carlisle. The Hon. Secretary, Mr. W. T. Steel, will be pleased to hear from any intending members, who should write to him at Rowan Lea, Blackwell Road, Carlisle.

Mr. John Batten informs us that he has now been appointed Secretary of the Smethwick and District Photographic Society in the place of Mr. Newman. His address is 7, Marshall Street, Smethwick, Staffs, to which address all communications should be addressed in future.

Stolen from Simpson (Piccadilly) Ltd., 202, Piccadilly, W.1, a 16-mm. Ditmar photo-cell model camera, f/1.6 focussing lens, camera No. 939. Will any reader who may be able to assist in tracing the stolen article please communicate with the above address.

Messrs. Wallace Heaton are desirous of communicating with a gentleman who has sent them two postal orders in payment for a camera case, supplied on the 11th October. The writer sent no name or address.

The Winter Season of the Norwood Camera Club has just commenced and a very attractive programme, including many interesting lectures and demonstrations, has been arranged. The Club extends a hearty welcome to all photographers in the district, and a programme will be sent upon application to the Hon. Secretary, Mr. A. R. Goenner, 62, Woolstone Road, Forest Hill, S.E.23.

Readers will remember that at the end of last year we drew their attention to the "Vent-Axia Silent Six" Air Extractor, a silent ventilating fan for the dark-room. The makers, Messrs. Utilities (London) Ltd., Walton House, 1, Newman Street, London, W.1, inform us that they have now put on the market a Senior model, which is de-

signed for ventilating larger rooms for industrial purposes. The construction is bakelite throughout, and the model handles approximately 400 cubic feet per minute and can be supplied for either stale air extraction or fresh air intake. The cowl is specially designed to prevent draughts, or the hold-up of rotor speed, even when high winds blow directly on to it, and it is perfectly weatherproof. The motor, which is absolutely silent, is designed to run at two speeds, medium or fast, and it is operated by a switch, supplied with the unit, which enables the user to effect the change of speed at will. The "Vent-Axia Nine" is British-made throughout, and the price, complete with switch, is £8 8s.

On the 12th October one of our readers, Mr. R. Walker, of Ingleholme, Norton Way South, Letchworth, purchased one of the latest Rolleiflex cameras, valued at £31 5s. On the 16th inst. the camera was stolen, the owner thinks probably by a common thief, as it was dark at the time. As the thief will probably attempt to sell or pawn the camera we would ask readers and dealers to note the number, which is 569033, Lens No. 1992130.

In the new "Ships and the Sea" Competition, organised by Wallace Heaton Ltd., the guinea award has been made to Mr. J. K. Neale, Northcliff, Penarth, Glam., for his print entitled "Fair Winds." Particulars regarding these weekly competitions for readers of "The A.P." appear every week in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ x 3½ x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

98. Makers' Formulæ : Developers for Kodak Papers—(1)

D. 157. Kodak Special Developer.

Eion (Metol) .. 17½ grs. (2 grm.)
Sodium sulphite (anhydrous) .. 350 grs. (40 grm.)
Hydroquinone .. 70 grs. (8 grm.)
Sodium carbonate (anhydrous) .. 265 grs. (30 grm.)
Potassium bromide .. 4 grs. (0.4 grm.)
Water to .. 20 oz. (1,000 c.c.)

If crystallised sulphite and carbonate are used, take 700 grs. (80 grm.) of each.

For use, dilute with an equal volume of water. D. 157 is suitable for plates or films as well as bromide paper, and may also be used for Bromesko. It can be used for bromide paper without dilution if desired.

This developer is available in packet form.

D. 158. Velox Developer.

Eion (Metol) .. 28 grs. (3.2 grm.)
Sodium sulphite (anhydrous) .. 440 grs. (50 grm.)
Hydroquinone .. 120 grs. (13.3 grm.)
Sodium carbonate (anhydrous) .. 610 grs. (69 grm.)

Potassium bromide .. 8 grs. (0.9 grm.)
Water to .. 20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double the quantity shown above. If crystallised carbonate is used, take 1635 grs. (186 grm.).

For use, dilute with an equal quantity of water.

It is important that this developer, and no other, should be used for Velox, which should be developed for 30 to 40 secs. at 65° Fahr.

D. 158 is available ready-made in several forms.

D. 163. Amidol.

Sodium sulphite (anhydrous) .. 220 grs. (25 grm.)
Dolmi (Amidol) .. 55 grs. (6 grm.)
Potassium bromide .. 2 grs. (0.15 grm.)
Water to .. 20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.).

Use undiluted. Gives blue-black tones on bromide paper.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Scratched Condenser.

The convex surfaces of the condenser in my enlarger have become slightly scratched. I am told that repolishing is expensive; is there any cheaper way in which I can repair the damage?
C. P. S. (Exeter).

Before considering any question of repair you should find whether the scratches do any harm. It is more than probable that they will be so out of focus that they will leave no trace on the enlargement. But if they do, the interposition of a sheet of finely-ground glass between lamp and condenser, or, if there is room, between the condenser and negative, will probably conceal them completely. You should try also the effect of using an opal bulb in the enlarger; this alone may be sufficient to prevent the scratches from showing. Apart from repolishing, the only possible remedy for scratches is to run into them a line of clear, hard varnish, which you will have to apply with a finely-pointed brush.

Photographing Same Size.

If I get a camera with double extension, can I make life-size negatives of small objects provided I use only half the lens so as to get a bigger image?
W. H. (Bolton.)

By using one half only of a convertible lens you get a lens of longer focal length than normal, and so get larger images of distant objects. But even to focus a distant object you will need to use nearly the full double extension of the camera. To focus for nearer objects, the extra extension needed, over and above that required when the camera is focussed on infinity, will be about double that needed with the complete lens; evidently, the absolute maximum of extension of which the camera is capable will be reached when focussing on an object still at a distance of several feet or yards from the lens, and no closer approach to the subject than this is possible.

Using the complete lens at the same

distance, the extension required would be much less (probably about half), and though the image at this distance would be smaller than that given by the half-lens, the limit of extension no longer prevents closer approach. Going nearer, and extending the camera more, will result in rapid increase in the size of image, and the ability to focus at closer range with the complete lens will eventually enable a much larger image to be had than the half-lens could give at the nearest distance at which it can be used. For full-size reproduction, the extension of the camera must be double the focal length of the lens, and the object must be as far in front of the lens as the plate is behind it.

From all this it follows that though a long-focus lens gives the larger image from a fixed viewpoint, a short-focus lens gives the larger image for the same maximum camera extension through allowing closer approach to the object.

Bleaching a Background.

I wish to bleach out a "busy" background from an enlargement of a snapshot portrait and to make a new negative from this print. I have tried ferricyanide and hypo, but it leaves a stain. What would you recommend?
J. L. (Northwich.)

First, dissolve about 20 grs. of potassium iodide in 10 oz. of water, and then add sufficient iodine flakes to make the solution a deep port wine colour. Paint this over the part of the print to be removed. The paper will turn a deep blue colour. Wash the print, and then place it in an ordinary hypo fixing bath. Almost instantly the blue colour will vanish, and there will be no trace of the photographic image. If there should be any sign of it repeat the process. Finally, wash well and dry. For your first trials we recommend a waste print, as the removal of the background without allowing the solution to run over the figure requires a little skill and practice.

Address of Society.

Could you please let me know the name of the nearest photographic society to my address?
R. W. S. (Balham.)

Your two nearest photographic societies are the Streatham Photographic Society, of which the Secretary is Mr. D. F. Weare, of 89, Bedford Hill, Balham, S.W.12, and the Wimbledon Camera Club, the Secretary being Mr. H. R. Meier, 10, Woodlands, Raynes Park, S.W.20.

D.76.

Can you tell me the special virtue, if any, of D.76 developer, what it is, and where it can be obtained?
A. H. O. (Yorkshire.)

The special advantage of D.76 developer is that it gives a fine grain, and that no extra exposure needs to be given to the film. The developer also keeps well in solution for a considerable time, which is often convenient. Chemicals ready weighed out, and put up in powder form, are obtainable from Messrs. Kodak. The formula used by the makers was published in the issue of "The A.P." dated June 16th, 1937, in the "Facts and Formulae" series.

Care of Meter.

Is a photo-electric meter likely to be damaged by the rattling and bumping about it might receive in travelling by car?
J. A. T. W. (Bromley.)

The mechanism of a photo-electric meter is no less delicate than that of a wrist-watch, and is liable to suffer if jarred. We do not think, however, that there is the slightest possibility of damage to your meter by carrying it in a car provided that it is kept in your pocket, laid on the seat, or wrapped up in a duster. But it would be wise to protect it from the sudden sharp knocks that it might receive if laid on a hard surface.

Chemicals in Solution.

It has occurred to me that when mixing developers at home it would be more convenient to keep the various chemicals in concentrated solution, and to make up the formula by mixing measured volumes of solutions rather than by dissolving weighed amounts. Is there anything against this scheme?
H. V. D. (Cheshire.)

We would strongly dissuade you from attempting to keep your chemicals in the form of concentrated solution. Neither metol, hydroquinone, nor amidol will keep for any reasonable period in solution, though the first two will do so if the solution simultaneously contains sodium sulphite or metabisulphite. If you want to keep your chemicals in solution the best way of all is to store them in the form of ready-made-up developer.

Import Duties.

If I buy a second-hand camera abroad, should I have to pay duty on the new or only on the second-hand price? And would the duty be 33-1/3rd per cent in either case?
R. P. (Gloucester.)

An imported camera has to pay duty on its value, and we presume that, so long as you produce a receipt for its purchase, a second-hand camera would be valued by the Customs officers at the price paid for it. Whether new or second-hand the duty payable is 50 per cent of the value.

STOCKTAKING SALE AT 66a SEVEN SISTERS RD. HOLLOWAY

LONDON, N.7

Telephone: North 3573.

ROLL FILM

3×2 Ensignette. Fair condition. 8s. 6d.
4½×2½ No. 2c Kodak, R.R. lens, Kodex shutter. Good condition. Cost £3 3s.

NIGHT-SNAPS!

INSTANTANEOUS and perfect photographs—such as this—can be obtained quite easily—at any time—indoors—night or day—with the Mazda Photoflood Lamp. You can turn any room in your home into a real photographic studio and be sure of results equal to those possible in bright sunshine.

MAZDA PHOTOFLOOD LAMPS FOR INDOOR PHOTOGRAPHY

Mazda Photoflood Lamps cost 2/6d. each, voltages 100-110 and 200-250. They can be fitted into any ordinary lamp socket and have a rated life of 2 hours. As the lamp is switched on only for the actual exposure, this means that hundreds of photographs can be made from one lamp.

will enable you to record delightful and intimate studies of the kiddies or pleasant photographs of friends and family in your home surroundings. Ask for the special folder giving full particulars of Mazda Photoflood Lamps.

GOOD!

THE NEW "SUPER BALDINA"

ADVERTISED BY US TWO WEEKS AGO IS THE FINEST THING EVER OFFERED IN 35-MM. PRECISION CAMERAS AT A POPULAR PRICE. WE ARE PLEASED TO REPORT THAT POPULAR OPINION IS BEARING OUT OUR JUDGMENT, AND WE HAVE BOUGHT UP THE ENTIRE FIRST SHIPMENT.

IT IS A 35-MM. OUTFIT WITH PARALLAX COMPENSATING VIEW-FINDER COUPLED TO RANGEFINDER, SHUTTER RELEASE ON BODY, AND RADIAL FOCUSING. THE COUPLED RANGE-FINDER IS PARTICULARLY EASY TO OPERATE, AND IT IS IMPOSSIBLE TO OVERWIND THE FILM (36 EXPOSURES ON USUAL LEICA SPOOL).

IT IS SMALL AND BEAUTIFULLY FINISHED. APART FROM THE HIGHLY-PRICED MINIATURES IT IS UNBEATABLE IN PERFORMANCE AND THE CHROMIUM AND LEATHER FINISH ENHANCE THE FEELING THAT ONE IS HANDLING A CAMERA WITHOUT A FLAW.

With 1/2.8 Zeiss Tessar..... £19 : 15 : 0

'AKRISKOP'

FOCUSsing MICROSCOPE
for Vertical Enlargers.

The manipulation of the "Akriskop" is of the utmost simplicity. The eye-piece is first focussed for the user's sight, the instrument is then placed under the lens of the enlarger at about the centre of the surface on which the enlarged image is formed. On looking through the eye-piece at a portion of the image, the latter is seen highly magnified, the lens of the enlarger is now adjusted until the grain structure of the emulsion is plainly seen.

Fam (fully automatic, no setting), 6-6 cm., Condenser, etc. **£18 18 0**
Any model on monthly payments.

A PERSONAL MESSAGE FROM WALLACE HEATON:

"I want to reiterate what I have said before. I am here at your service, willing and anxious to help every amateur photographer. Many have not yet taken advantage of my two-year easy payment plan. I want to tell them how easy, how free from irritating formalities, and how confidential it is. Take Home Movies, for instance, for 4- or 5- a week you can own a first-class instrument. Write to me personally, tell me what you can afford, and let me make a few suggestions of suitable machines. I want you to remember that I am here to help you."

Wallace Heaton

A SHILLING A DAY BUYS THE NEW Automatic ROLLEIFLEX ON WALLACE HEATON'S EASY TERMS

STUDY THE NEW FEATURES OF THIS AMAZING CAMERA:

Automatic film wind, which in one action automatically sets the shutter, prevents double or blank exposures, sets the built-in self-timer for delayed action.

Loading. No red window is fitted, for you merely load your film in the ordinary way, crank the transport handle like an ordinary cine camera, when the film automatically stops at No. 1 ready for the first exposure to be made and the number is registered in the counter window.

Exposing. After each exposure has been made, the film is wound for the next exposure—the shutter being set automatically at the same time. After the 12th exposure has been made, the film automatically releases itself and the film wound off and taken out of the camera in the usual way.

Self-Timer (built-in). As already explained above, is automatically set after each exposure, allowing a delayed-action period of 12 seconds. (The self-timer need not be used, but is already set for use if desired.)

Larger aperture finder lens, now f/2.8, giving, of course, a brighter screen picture.

Improved controls for manipulation of shutter speeds and lens apertures in the form of two milled discs which can be operated with the greatest ease whilst the camera is in the taking position.

Peep window in which are seen at a glance the shutter speeds and lens apertures with the camera in the taking position, shows the readings in magnified form by means of a cylinder lens over the peep window.

Reflex hood is fitted with large magnifier and for taking pictures at eye-level, the object is viewed through a mirror and double magnifier combined.

Depth of focus and focusing knob combined. Engraved exposure plate at back of camera.

Zeiss Tessar f/3.5 lens. Compur Rapid shutter speeded to 1/500th sec. and Bulb.

Embodies all the well-known Rolleiflex features, including 12 pictures 2½ - 2½ on a 3½ - 3½ roll film for 1-. Seeing your picture full size right way up all the time on the glass screen, etc., etc.

CASH PRICE . . £31:5:0
**24 MONTHLY
PAYMENTS of 28/-**

"AUTOMAX" (REG.) ENLARGEMENTS—3½" - 3½" from your ROLLEIFLEX negatives at 2 6 a dozen.

HOME-MOVIE DEMONSTRATIONS

We have London's most comfortable model theatre which is open to you to see and hear the latest home movies and talks. Experts are in attendance who will give you unbiased advice on your choice of apparatus. (Give us a call when in town, there is no obligation on your part. For Plate Cameras

ILFORD

**HYPERSENSITIVE
PANCHROMATIC PLATES**

Photography doesn't end at sunset these days. Unique opportunities for unusual snapshots wait for you now after dark. Simply load your camera with SELO Hypersensitive Panchromatic Roll Film or Ilford Hypersensitive Panchromatic Plates — and picture-making by night becomes at once as "easy as daylight." Whether it's the lamp-post in the village street or the brilliant illuminations of a seaside promenade, you will get equally fine and *original* results—so outstanding is the speed of these remarkable plates and films. At home, also, you can have great fun making portraits of your family and friends—as well as snapping many gay incidents of domestic life.

The AMATEUR ^{4^D} PHOTOGRAPHER

& CINEMATOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXXIV.

Wednesday, November 10th, 1937.

No. 2557.

This Rolleiflex Picture

sparkling with life and vitality gives an idea of the perfection that can be easily attained by any Rolleiflex user. Rolleiflex has overcome the difficulties of an indeterminate atmosphere created by scintillating snow and ice. Thanks to the full-size picture on the focussing screen, the photographer was able to snap the figure in the 'exactly right' artistic pose. Rolleiflex gives you speeds up to 1/500th sec. to play with, and the F/3.5 Zeiss Tessar lens will do everything you ask of it. The new automatic model has advanced features which will put you right on the road to photographic success. It takes 12 pictures on $3\frac{1}{4} \times 2\frac{1}{4}$ 8-exposure roll film for 1/- and can be adapted for plates or 35-mm. film. It costs £31.5.0

FINE and WARM

It is an interesting psychological fact that most people respond more readily to a photograph in warm tones than to one of the more conventional cold black variety. There is a certain appeal about the cheerful warm image, a subtle richness and glow, that catches the eye and flatters the subject and makes a genuine picture out of a snapshot.

Unfortunately, as you know, for certain technical reasons warm-toned pictures—more especially warm-toned enlargements—used to be more difficult to make than ordinary ones. That was, until “Bromesko” paper came along.

“Bromesko” made a clean break with tradition by being the *first warm-tone Bromide paper*.

The advantages of both kinds of papers are

united in “Bromesko.” On the one hand, warmth of tone and rare beauty of image. On the other, Bromide paper speed and ease of manipulation, economical Bromide prices. “Bromesko” is, in short, not only a new paper but a new kind of paper.

Whether you are entering some cherished enlargements for the club exhibition or simply having some pictures made for home decoration, try “Bromesko” and give your negatives the treat of their lives.

‘BROMESKO’

Assorted “Bromesko” Packets—the best way of trying out “Bromesko.” Three varieties of grade and surface in each 12-sheet packet. Size : 8½ in. by 6½ in. 3/- per packet. Four assortments. From your Kodak Dealer. Ask him for free “Bromesko” Booklet or write to Mr. A. P. Taylor, Dept. 57B.

AN "INDOOR" PHOTOGRAPHIC COMPETITION

FIGURE STUDIES & PORTRAITS

Here's a welcome competition—ideal for the long dull evenings. Try your hand at indoor portraiture (it's quite easy with two or three Photoflood lamps), or snaps of spontaneous indoor groups sometimes hit the target and make masterly studies. Start to-night and see what you can do. Of course, if you have any good outdoor figure studies or portraits you can send them in. You can use any camera or materials you choose. There's no entrance fee, but coupons found in these competition pages each week must be attached to your entries. Note, this competition is for amateurs only. All entries will be judged on their photographic excellence.

RULES AND CONDITIONS

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS only (full name, address, title of entry and coupon on back of each entry).

ANY MAKE OF CAMERA OR MATERIALS, DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED (not less than 8 x 5 unmounted is recommended). SPOTTING ONLY TO REMOVE DEFECTS (no faking or retouching).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS (if a guinea prize-winner, for an extra guinea), OR RIGHT TO ONE REPRODUCTION, 10s. 6d.

Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd. without further payment.

£25

**FIRST
PRIZE**

Prizes are 21/- each week and 6 Certificates of Merit. £25 (twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry.

A selection of the best entries will be held back at the close of the competition for exhibition in our galleries prior to their return. Our gallery is always interesting, call and see it when in Town—free, of course.

21/-

**WEEKLY
PRIZE**

WALLACE HEATON COMPETITION

COUPON to be affixed to back of print. Valid until Competition closes on December 31st, 1937.

Enclosed is my entry for "....." Competition.

I agree to the rules and conditions.

NEW!— PATHÉSCOPE "S" 9.5-mm. DE LUXE PROJECTOR

For 300-ft. and 800-ft. Reels. Sprocket Fed.

Non-commutator, synchronous motor ensures very smooth running at a speed of either 16 or 24 pictures per second. Fitted with a high efficiency, low voltage, high amperage 200-watt lamp (15 volts, 13 amps) and is transformer fed. The guideway and the presser pad are easily accessible for thorough inspection and cleaning, while, following projection, the 800 ft. of film can be rewound by motor—35 minutes' projection without changing reels. Built-in pilot lamp. For use on all A.C. mains from 110 to 250 volts.

Cash price **£30:0:0**

24 monthly payments of 28/11.

NEW!— "KODASCOPE" 50-R 8-mm. PROJECTOR

The extra-powerful 200-watt lamp gives brilliant picture measuring 30×22 in. 14½ ft. from the screen, or 40×30 in. at 19 ft. Can be used on any circuit by means of small interchangeable plug-in resistances. Fast motor-driven rewind, large cooling fan and sturdy construction are among its features.

Price, including 1-in. lens **£13:13:0** and accessories

24 monthly payments of 12/3.

BOLEX G916

For both 9.5 and 16 mm. films.

This machine is entirely gear driven, there being no belts whatever. With Dallmeyer 2-in. projection lens, including all accessories to project both sizes of film, and 110-volt 500-watt lamp.

Cash price **£45:0:0**

24 monthly payments of 40/4.

A MESSAGE FROM OUR MANAGING DIRECTOR

"I wish to thank the many hundreds of customers for the unsolicited testimonials they have sent to the managers of the shops under my control. I can assure you that everything possible will be done to keep up the good reputation we have achieved."

Wallace Heaton

CORONET MODEL II PROJECTOR

Sprocket drive. Brilliant flickerless pictures. Silent running. Geared rewinds 5-1 ratio, rewinding in a flash. Combined lamp and wall plug. Takes 30, 60 or 400 ft. reels without adjustment. 1-in. anastigmat projection lens. Any voltages 100-250, A.C. or D.C. With motor drive and super attachment.

Cash price **£9:17:6**

15 monthly payments of 13/7.

SIEMENS "SIXTEEN-9"

Takes 9.5 and 16 mm. films. Has 200-watt lamp, speeds 12 to 28 pictures per sec., motor rewind. Single-picture device. Silent take-up. Simple threading. Self-contained resistance. Centring device and safety switch. You can't go wrong in choosing Siemens.

Cash price **£59:10:0**

24 monthly payments of 58/4.

NO DEPOSIT—AND NOW IS THE TIME FOR THAT

First of 24 monthly instalments secures any instrument costing £10 or more. If you are interested in anything below £10 tell us what it is and we'll quote our special terms. Every deal confidential.

Every bargain USED but fully guaranteed. They'll save you pounds.

ORGANIZATION IN GREAT BRITAIN

NEW BOND ST., W.1; 47, BERKELEY ST., W.1; 1a, AVERY ROW, W.1; and GOSH ST., W.8.

"ENLARGING" Time

Short, dull days and inclement weather may, perhaps, restrict your outdoor efforts, but there are always indoor pursuits to open up new possibilities of delight for enthusiasts. Enlarging, for instance, has a fascination and "worth-while-ness" that appeals to increasing numbers of amateurs. The Westminster offer you a wide choice of modern apparatus, and—of course—the full advantages of the WESTMINSTER EASY PURCHASE PLAN.

Ensign MAGNAPRINT ENLARGER

Fitted with friction drive, rising and falling movement and other features.

Model V/10, for 6 x 6 cm. negatives, f/6.3 Ensign anastigmat **£8:10:0**

12 monthly payments of 14/10.

Model V/11, for 2 1/2 x 3 1/2 negatives, f/6.3 Ensign anastigmat **£9:10:0**

12 monthly payments of 17/7.

Model V/2, for 3 1/2 x 4 1/2 negatives, f/6.3 Ensign anastigmat. **£13:10:0**

12 monthly payments of 23/8, 24 of 11/10.

Also with f/4.5 Magnar lenses.

LEITZ FOCOMAT

Vertical Automatic Enlarger.

Takes the standard 5-cm. focus lens, screw-in fitting. Scaled from 2 diameters up to 10 diameters. Will take negatives 18 x 26 mm., 24 x 36 mm., 3 x 4 cm., and 4 x 4 cm.

PRICE

£16:6:6

12 monthly payments of 28/7, 24 of 14/4.

ENSIGN SELFIX '220'—for Value

This camera, noted as a pioneer of the self-erecting principle in the inexpensive camera, is now offered in a new form, taking 12 pictures 2 1/2 x 2 1/2 or 16 2 1/2 x 1 1/4 at option. Direct optical finders, adjustable to either side, mechanical film counter, similarly adaptable, focusing and depth-of-focus scale and most handsome lustre chromium finish.

F/7.7 Ensign anastigmat, Trichro shutter, speeds 1/25th, **£2:15:0**

1/50th, 1/100th, T. & B. **£3:5:0**

F/6.3 Ensign and Trichro shutter, as above

9 monthly payments of 7/10.

Ensign f/4.5 anastigmat and Trichro shutter **£3:15:0**

9 monthly payments of 8/11.

Ensign f/4.5 and Pronator II shutter **£5:15:0**

12 monthly payments of 10/1.

Zeiss Tessar f/4.5 and Compur shutter **£9:15:0**

12 monthly payments of 17/1.

WESTMINSTER Victoria 2.9 lens

Ideal for Winter Snaps

Ultra-modern roll-film camera for 16 pictures 2 1/2 x 1 1/4 on normal 3 1/2 x 2 1/2 spool. Quick self-erecting front, with f/2.9 Steinheil Casar anastigmat, focusing mount. Particularly efficient optical finders. Quick and easy loading, panoramic safety covers.

Model I, Compur Rapid shutter, 1 to 1/400th sec., T. and B., and delayed-action release on **£7:19:6**

12 monthly payments of 14/-, Other Models at **£5 15 0** and **£4 19 6**.

THE NEW ROLLEIFLEX

In this new model the 6 x 6 cm. ROLLEIFLEX for 12 pictures on usual 3 1/2 x 2 1/2 spool becomes more than ever automatic, revealing a still higher standard of optical and mechanical perfection. Only one action is now needed to:—

- (1) Set the shutter;
- (2) take your picture, either blank or double exposures;
- (3) to give delayed action. There are also amongst other improvements, new controls for shutter speeds and lens apertures with magnified readings. The reflex hood is fitted with larger magnifier, and there is a double magnifier and additional mirror for eye-level use. Lens is f/3.5 Tessar, with Compur Rapid shutter speeded to 1/500th sec. **£31:5:0**

12 monthly payments of 54/8, 24 of 27/4.

● PATHESCOPE'S FINE NEW ACHIEVEMENT

NEW PATHESCOPE "S" PROJECTOR
for 300-ft. or 800-ft. 9.5-mm. reels. **PRICE**

Built of high quality die castings, ultra-smooth running motor, sprocket fed, motor rewind. High intensity lamp provided. Gives superb brilliance of picture, with economical

current consumption, whilst projection is remarkably free from flicker. Super cooled lamphouse and separate pilot lamp provided. Gives performance of full theatre standard in your own home.

£30
Obtainable of course on usual WESTMINSTER Out-of-Income Terms.

For all voltages 110/250.

"There's a story behind these pictures"

says Mr. A. G. Willis of
Compass Cameras Ltd.

Awarded Certificate of Merit

The Compass Camera
half-size extended

We were regularly receiving some excellent negatives for processing from a Mr. Reginald Lionel. The negative of the recumbent figures reproduced here was technically perfect; then followed a very good portrait, also shown. Requesting permission to reproduce them, we asked Mr. Lionel for his opinion of Compass. We are quoting his letter:-

"... Compass System told me what filter and stop to use"

"As a matter of fact, before this Summer, I had only taken a few snap-shots with a cheap box-camera. The Compass appealed to me because it claimed to teach you how to take good pictures. So I studied the simple book of instructions and started. Within the first dozen I had taken a portrait study that was awarded a Certificate of Merit by 'Amateur Photographer'.* I felt very pleased; but it was the Compass System that told me what filter and stop to use and at what speed to set the shutter.

"I have used the Compass System throughout and have secured results that not only please me, but really interest my friends. I'm always asked 'What camera do you use? I can't get results like that,' usually followed by 'But you must be an expert photographer.' Of course, they never believe me when I assure them I'm only a novice; but it's true enough."

*"Amateur Photographer," August 25, 1937.

We are naturally delighted to know that Mr. Lionel is another Compass owner who has proved our claim that the simplicity of the Compass System makes it everyone's camera. We consider the pictures reproduced here, typical of the results which should be obtained by any user of the Compass System. If any Compass user is not obtaining such results, we should be glad to hear from him. We are anxious that the extensive services we offer Compass owners should be utilised to the fullest extent.

GRANVILLE GULLIMAN & CO. LTD. LEAMINGTON SPA

£50 GIVEN AWAY! ★ ★ ★ ★

★ The NEW 16-mm. "Gorse-Devry" Sound Projector saves you £50 against any other make of similar value, light and features. Also this new "Talkie" has many essential features not obtainable in any other machine in the world's market.

SENSATIONAL "TALKIE" VALUE

★ 16-mm. "Gorse-Devry" Sound Projector, largest super lens, 750-watt direct illumination, via 2-in. large condensers and booster reflector, 8-watt genuine volume (17-watt peak), 1,600-ft. capacity by unique "swing-up" reel arms, illuminated controls on onyx panel (seen in the dark during projection), double exciter lamps (slide one in position if the other fails without stopping the show), quickest "no delay" threading, accessibility to all threading parts, finger and hand room with minimum sprockets, silent or sound speeds—silent speed is adjustable; detachable gate—dirty and woolly fringed gates are a thing of the past. Rubber mounted throughout by Silent-broc. Amplifier has three controls, volume control, tone control, microphone control, by large circle pointers giving minute adjustment. The tone control is an essential "talkie" feature, as

it can be regulated to suit hall "acoustics," voice, music or vocal. Microphone socket fitting, and gramophone fitting are features to provide speeches or records to own silent films. The amplifier components are "over-size" standard theatre ones, maintaining the "De Vry" policy of the finest value for money, long life and perfection.

And here is the "Heart" of the machine—the film drive is by perfect intermittent sprocket which holds film in edge contact continuously by rotation. There is no "push in and out," "grab and miss" claw action. The "De Vry" has the "theatre" movement which has proved to 35-mm. people to be the only action for perfection. Intermittent movement needs no oiling, and costs a large amount to produce, against claw which is a simple punch press job.

AND NOW—The price saves you £50 over any other similar value £135

Correct Exposure

CORRECT STOP

CORRECT DISTANCE

Upon these three factors, especially in night photography, depends the perfect photograph. Every doubt on all these points is removed by the Contaflex, in which is incorporated the following technical aids to good photographs under difficult conditions:

- Built-in photo-electric exposure meter.
- Special type focussing screen automatically compensated for parallax, showing an image double the negative size and giving a brilliant image even in the corners.
- Interchangeable Zeiss lenses, apertures up to the Sonnar f/1.5—focal lengths up to 5½ in.—all indicating the depth of focus at any given lens stop.
- Metal focal-plane shutter with speeds from ½ to 1/1,000th second.
- Delayed-action shutter release for self-portraits.
- Sports view-finder by Van Albada.

The only miniature (24 × 36 mm.) reflex possessing the above features.

Contaflex

The Contaflex and all other Zeiss Ikon 24 × 36 mm. cameras sold in Great Britain and Ireland at current listed prices carry a 3-year guarantee.

Write for a copy of the Zeiss Ikon 96-page catalogue of miniatures, "Contax Photography," or ask your dealer for a demonstration.

WEDNESDAY, NOVEMBER 10TH, 1937.

Copyright—Registered as a Newspaper
for transmission in the U.K.

VOL. LXXXIV. No. 2557.

WE found very interesting the dive back to the very earliest days of film production with which Mr. Baynham Honri treated the Cinematograph Group of the R.P.S. the other evening. He not only showed pictures of the earliest film studios—the earliest in England was that of Robert W. Paul at Southgate—but photographs of famous early operators at work. The earliest studio with any pretension to architecture was Edison's in America. This was followed by the Gaumont studio in England, built in 1914. Mr. Honri said that a survey of early methods of working seemed to point to the possibility of reviving certain obsolete methods. Indeed, in some cases this had already been done. For example, many early projectors had a claw movement and were noted at the time for their extreme steadiness. The claw movement was bad for old copies with torn perforations, and since that time had only been used in cameras. But now it had come back in projectors for rear shots in the studio. Talking about back projection, the magic lantern has been taken up again at Stoll Studios, where very promising results are being obtained in situations where a painted back-cloth would previously have been used.

The P.D.A. Dinner.

Again this year the Photographic Dealers' Association has had an opportunity of demonstrating what an active and progressive body it is as a whole, and also what good feeling and comradeship exists between its members individually. This state of things was obvious at the annual dinner held last week at the Park Lane Hotel, Piccadilly, under

TOPICS of the Week

REMEMBRANCE DAY, NOV. 11TH.

Once again the world will look upon the scene at Whitehall through the medium of photography.

the presidency of Mr. Alec Hoare, of Derby. Nearly 500 members and guests filled the ballroom of the hotel to capacity; all branches of the photographic trade from every part of the country were present, and representatives of all other phases of photographic activity were there also. The guest of honour was Lord Iliffe, who proposed the toast of the P.D.A., and referred in flattering terms to the work of the Association, which, since its foundation in 1914, with a membership of 500, to the present time, with a membership of 10,000, had gone steadily forward. His Lordship, in congratulating it on a very successful year, took the opportunity of referring to the Royal Photographic Society's appeal for funds for their new premises. He emphasised the debt owing to the Society by photographers generally and photographic dealers in particular, for its work done to encourage photography of all kinds and in its many applications. The President, in replying for the P.D.A., stressed the excellent services rendered by its secretary, Mr. E. J. Andrews. After the dinner an attractive cabaret was presented, and dancing followed until 2 a.m.—an entirely successful evening.

A Local Narrative.

Our amateur cinematograph societies must sometimes have a discouraged feeling that, however ambitiously they go to work, they can never reach the interest and technical excellence of the professional news film on the one hand, still less the big story production on the other. Nevertheless, there are directions, to be found with a little thought and searching, in which a film can be constructed having an interest quite beyond anything which

could be—or at any rate is likely to be—compassed commercially. We saw lately a film simply entitled "Flood," by W. King, of the Cambridge Photographic Society Ciné Group. It told the story of the Fenland floods which excited such national attention a few months ago. Everything which could be drawn upon to illustrate the story had been taken—the brimming waters, the men working on the threatened banks, the tenseness at the pumping station, these and innumerable local incidents to tell the tale. Now, that is exactly the kind of film which is invaluable as a local record, and which on account of the occasional thrill which it conveys has a wider interest, and yet at the same time the sort of film which would not be covered by the ordinary film agency. The latter would simply pay a flying visit and take what offered at the moment, whereas in this film the whole of the events were carefully followed through. It was more than a flash of news, it was a careful study of its subject.

Photography in Switzerland.

A correspondent writes from Switzerland how greatly he has been impressed by the activity of amateur photography in that country. The number of shops of photographic dealers in Geneva is only outclassed by the number of tobacconists and pastrycooks. The miniature in various forms is booming right and left. The shops where photographic goods are sold all seem to have adopted the same colour scheme, a predominant orange background, which is very effective for showing off their goods. Some of them have little pillar boxes, also painted orange, inviting you to post your films therein before ten in the morning with the certainty that you can call for the result (if any) the same afternoon. How big a business it is—this show business—is demonstrated by one corner shop on a Geneva thoroughfare which exhibits a crowd of cameras of all sorts, as well as the results to be expected from them, in no fewer than five large windows and seven show-cases. Our correspondent has

also been in touch with the Geneva Photographic Society, a very live body, which is now organising an exhibition on London lines. Recently they had a colour evening and showed a hundred slides in natural colour photography, all of local scenes, but all of outstanding quality. The reason for this photographic "push" may be that Switzerland has an abundance of material for photography. At the same time much of the work of the Swiss amateur is concerned with material which is equally available in England or anywhere else, and very little of it is high mountain stuff. There is a great vogue at present for night scenes. The way in which the multitude of electric lights shine out like diamond points in the clear air makes an irresistible appeal, and the extreme popularity of the miniature camera, with its very fast lens, has naturally had the effect of making night subjects possible for very many photographers. But whether taken with a miniature or not, many of the results are most successful.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Depth-of-Focus Table.

I enclose a table showing the distances marked on the focussing scale of my camera, and the f/ numbers of the stops on the lens. Will you please fill in the necessary figures showing the depth of focus for them all?

D. K. (Salisbury.)

We regret that we always have to decline to work out depth-of-focus tables for individual readers, although we are often asked to do so. The work is simple, but takes considerable time; and in any case it cannot be done at all unless all the necessary factors are known. You yourself omit two of them—the focal length of the lens, and the diameter of the circle of confusion. What we have frequently done is to explain the method of working out a table, and this information we will again repeat.

The focus of your lens is most probably marked on it. As regards the circle of confusion you must decide this for yourself. You must imagine that you have focussed sharply a point so small that it is almost invisible. If the image measures 1/100th of an inch in diameter that is called the "circle of confusion." This diameter was once considered small enough; but of course the more you enlarge the bigger the "point" becomes, and in these days of great enlargement it is considered that the point in the negative should not measure more than 1/300th of an inch across. You then use the number 300 in your calculations.

First find the "hyperfocal distance," thus:—

$$F \times F \times 300 \div 5$$

Here F is the focal length of the lens, and 5 is the number of the stop. When you focus on this hyperfocal distance, everything is sharp from that to infinity. The distance varies with the stop; the smaller the stop the nearer the distance.

Now you can find the depth of focus for each distance marked on the scale. Call the hyperfocal distance H and the distance on the scale D. Then

$$(H \times D) \div (H + D)$$

gives the nearest point in focus, and

$$(H \times D) \div (H - D)$$

is the farthest point in focus.

These two distances can be found for every distance marked on the focussing scale, and for each of the stops of the lens. The definition does not alter suddenly at these distances; it falls off gradually.

All distances must be measured by the same unit—the inch or the centimetre; but the final distances can easily be converted from British to metric, or vice versa.

Enlarged Negatives.

Not wishing to incur the great expense of plates I have tried making enlarged negatives on bromide paper, but I find the grain of the paper too pronounced. Is there any alternative method that will avoid this?

N. T. A. (London.)

You might try Transferotype paper instead of ordinary bromide. It is about the same price, and only sheets of plain glass are required in addition. You must, of course, make a positive from the negative first, either by contact or enlargement, and the Transferotype paper may be used also for this.

Full instructions are given with the paper, but there is an important point to remember when making a transparency, either positive or negative. Find by trial the correct exposure to give a good print when developed right out; then give three or four times this exposure, and again develop right out. The result is hopeless as a print, but satisfactory when stripped on to glass.

Some Notes on Artificial Light Photography

At the present time there will be many photographers making a first attempt at indoor photography by artificial light. This branch of work has done much to provide an active interest in photography all the year round, and it is safe to say that many amateurs now derive as much pleasure from negative-making during the winter evenings as in the summer. This work is within the scope of the photographer possessed of simple apparatus, it is not by any means confined to the possessor of "de luxe" equipment.

FOR artificial-light photography super-rapid panchromatic plates or films will probably be chosen by the amateur for first experiments. He has been told that they are highly red-sensitive, and artificial light being largely composed of these rays, exposures will be very short. This is quite true and it is possible to secure fully-exposed negatives on super pan. film by exposures of short fractions of a second, under favourable lighting conditions, if a large-aperture lens is available. But this is not always necessary, although some subjects demand it, and could not, in fact, be attempted at all without the use of the fastest material obtainable.

Orthochromatic Plates and Films.

There are many subjects that can be dealt with by artificial light at home that do not call for such rapid exposures, and many workers do not realise that high-speed orthochromatic material will give very good results, and is more easy to handle in the dark-room. These plates and films are very sensitive to artificial lighting, and for studio work a number of leading professional photographers use nothing else.

For many subjects such as flowers, still life, and those where there is no liability to movement, and for which a long exposure is not objected to, there is much in favour of the use of "ortho" material. The colour rendering is very satisfactory, and no filter will be necessary. Some years ago a mild sensation was created in the photographic world by photographs taken by an amateur in candle light on the fastest ortho plates then available. Exposures were long compared with what could be given now but the results were remarkably good.

Using fast orthochromatic films or plates, it is possible to secure well-exposed portrait negatives, with two to four seconds at $f/4.5$ by ordinary domestic illumination such as the electric lighting of an ordinary room.

Subject Contrast and Lighting.

One of the advantages offered by this form of indoor work is that the photographer has the opportunity of exercising complete control over the lighting of his subject.

In this respect a word of warning should be given against the use of too strong, unscreened illumination under the mistaken idea that this will reduce exposure. This is not always the case, for strong contrasts are produced, and at the cost of pleasing modelling of the subject.

Avoiding Harsh Shadows.

The fact that the photographer has the lighting under his control may tempt the beginner to ignore strong contrasts. But the difference between high-lights and the shadows, in a photograph taken with a minimum exposure, is too pronounced, and the effect, for portrait work, unsatisfactory.

When high-power illumination is used a diffuser between the subject and the lighting should always be employed with a view to softening the brilliant light and the avoidance of hard shadows. Many photographers seem reluctant to do this, under the impression that the exposure will be prolonged. Actually, a light diffuser consisting of thin white butter muslin makes only a slight increase in the duration of the exposure, while it ensures a softer and more pleasing illumination.

It is also a good plan to use a plain white reflector on the shadow side of the subject. This will assist in removing hard shadow such as the shadow cast by the nose in the case of a portrait subject. Care should be taken to keep the illumination as far as possible from the sitter. Many photographers make the mistake of placing it too close, and especially when using lamps of the "Photo-flood" type. It is much better to secure good modelling with an increased exposure than risk harsh contrasts to save an extra second.

Exposure.

One of the first questions that the photographer new to this work will ask is, "What exposure?"

This, as is the case with outdoor subjects, depends upon the subject, the lens aperture and the speed of the material, as well as the distance that the subject is from the light. There are several photo-electric exposure meters now on the market that

respond fully to artificial light, and if the worker possesses one of these the problem is easily solved.

If, however, he has no meter, he can arrive at a working basis for his exposures by a few trials, and although this may mean wasting one or two films, it is worth it for future guidance.

Making Trial Exposures.

While it is not possible to give definite data, it is an easy matter for the photographer to find out for himself what exposure to give if he has a plate camera taking dark slides or a film-pack adapter. In this case a plate or film is exposed upon a stationary subject, with the camera upon a tripod, in the following way. The slide of the plate-holder or film-pack adapter is drawn, about a quarter of its length, and an exposure of one second given; it is then drawn a further quarter, and another second given; a third quarter is given two seconds and the last quarter four seconds. The negative will show a graded series of exposures of one, two, four, eight seconds, and will indicate approximately the exposure required for that type of subject under that particular illumination.

If the lighting conditions change, or the subject contains more shadow, further allowance can be made. After a few trials, provided the same material is used and the power of the light is the same, correct exposures will be estimated very closely for all future work.

Development.

The majority of subjects photographed by artificial light belong to the class for which negatives of the "soft gradation" type are advocated. This means that the photographer must be careful not to carry development too far. Portrait, fireside subjects, still life, need to be kept on the soft side, and it is fatally easy by over-development to make the subject too contrasty in the print. The photographer who uses a tank for development should reduce the time of development by one quarter. Full exposure and short development will produce negatives of the right type for enlarging.

Going, Going

By

DONALD G. SHELDON.

A new reservoir is now under construction, and this will engulf the bridge, as well as the village and the fine old Derwent Hall which stand near-by.

It is the same with the subjects of the other illustrations. Queen's Dock, Hull, has been filled in, and the Wilberforce Monument no longer obstructs

Demolishing the Deanery at York (August, 1937).

ONE of the most valuable privileges of being a photographer is the ability to record scenes and customs which are being swept away. Change must come, but the camera can preserve for us the appearance of the original state of things, and this with an accuracy and ease impossible by any other graphic means.

We can seldom forecast what things will be "here to-day and gone to-morrow." The invention of a new method of transport, a new discovery in the realms of nutrition or medical treatment, the construction of a new road or reservoir, an altered by-law or a new town-planning scheme—any of these may destroy for ever things which we had regarded as permanent features of our daily life.

Take, for example, the bridge picture accompanying this article. Here is a fine old packhorse bridge, built in the thirteenth century. Much water has flowed under its arches in the seven hundred years that it has spanned the Derbyshire Derwent. Yet, within a few years it will be gone, and the water will flow *over* the place where it stands.

York Castle, as it appears to-day.

York Castle, with surrounding wall, as it was in 1934.

the street but stands in the gardens made where once the ships and barges were moored. Cars are no longer slung by crane on to the Humber ferryboats, but run straight on to the boats from a new floating pontoon. The black 100-year-old wall which surrounded the mound and Norman castle at York has been demolished, and "Sidney Smith's hard nut" (as it was once termed) has ceased to obscure the view of the castle from the passer-by.

What a pity it is that photography was not invented earlier. Some amateur would have recorded old London Bridge, the first railway journey, the sailing of the *Mayflower*, or the features of Shakespeare; and how interesting we should consider these to-day.

ing—Gone!

Every camera user should hasten to photograph as many as possible of his local scenes, people, and customs, or changes may occur before he is aware of them, and the chance will be gone for ever. The print called "Demolishing the Deanery" shows what may happen if opportunities are neglected. I had always felt that there was a picture waiting to be made at York Deanery. There was, and I took it last year. But this print shows how I would have fared had I left the job until my last visit a few months ago. "Gather ye rosebuds while ye may . . ."

The Wilberforce Monument, Hull, now removed to another site.

Queen's Dock, Hull, as it appeared a few years ago. It is now filled in and the Wilberforce Monument (see above) stands in the foreground of the view shown here.

Old Packhorse Bridge at Derwent, Derbyshire. This will be submerged when the Lady Bower Dam is completed.

In these days of easily pocketable cameras there is little excuse for being too late. Thanks to the excellence and cheapness of modern photographic materials and apparatus, it is easier than ever before to keep a picture diary. Many workers are alive to this, and make a habit of carrying their cameras wherever they go. By so doing they obtain many pictures which cannot be repeated later, though they do not suspect this at the time of taking.

Photographic customs, like everything else, change as the years go by. Few of those who carry a tiny camera in vest pocket or handbag give a thought to the days when the photographer carried a portable dark-room and coated his whole-plate glasses with emulsion on the spot. I have never seen a photograph of one of these old-time enthusiasts loaded up with his hundredweight or so of apparatus. All the textbooks I have seen illustrate him by means of a line drawing.

Evidently nobody thought that the poor man earning his pictures literally by the labour of his hands and the sweat of his brow was worth wasting a plate upon. So when your friends bring out their little gems of cameras, picture them for posterity. Don't treat them like our old wet-plate friend—though he, too, was ultra-modern once!

Loading a car by crane on to the Humber Ferry. The opening of a new floating landing stage this year has done away with this method of loading cars.

Readers' Hints, Tips and Gadgets

USING A CAMERA FOR ENLARGING.

IN view of the reference made a few weeks ago in these pages re using one's own camera for enlarging purposes, the following description of an "adapter" made by the writer for this purpose will doubtless be of interest.

It was extremely simple to manufacture, and it does its work in a very efficient manner.

The main trouble in using a camera for enlarging is the getting of sufficient adjustability into the distance from the lens to the negative to give varying degrees of enlargement.

In the scheme shown this is overcome by the whole camera sliding in relation to the negative, which is fixed.

The adapter consists of a box (A) fitting closely round the camera, (B) a baseboard upon which the camera stands (and slides), and to which the rest is built, (C) a card "sandwich" to hold the negative, and (D) a back fitted with runners of wood into which the "sandwich" slides.

The writer has used the adapter with a lantern body having a condenser and with a reflecting light-box (see the lower sketch) but there is no reason why it should not be employed with daylight as the illumination coming through an opening in a covered window.

Construction is started by making the box (A) of three-ply wood (stiff card would do as well) which has to sit as tightly as possible round the camera. No dimensions are given in the illustration as, of course, these will differ with every make.

The sides are secured to the base by short screws, and the top by small sprigs driven in horizontally. Rigidity is secured by fitting the back (D) again with small sprigs. When this is in position it will be found that the whole box is very sturdy. To help light-tightness the upper edges are covered with strips of black paper.

In the back (D) the rectangle (f) is cut just the size of the negative normally worked from.

Down the sides of the opening two runners (g) are fitted. These are merely two strips of wood, the one slightly narrower than the other, as (h) fastened by small screws.

The "sandwich" (c) to hold the negative is two rectangles of card with a suitable opening cut out of both as indicated and hinged together by linen tape. The negative holds quite well by friction alone, when the cards are closed together and placed in the runners.

As the rectangle (f) is small compared with the whole back of the camera, it will be found that no light escapes forward,

but should too loose fitting of the camera allow a certain leakage, this can be stopped by fitting a sheet of card cut as (h) over the front of the camera.

To further prevent leakage and reflection the whole of the adapter is finished in matt black.

To use, the frame is fitted up to the light source, the negative is placed in the "sandwich," which in its turn is inserted in the runners. Rough focus is obtained by moving the camera as a whole in the frame, and final adjustment is made by the focussing movement on the camera itself. H. A. ROBINSON.

A MAGNETIC ENLARGING EASEL.

ONE of the greatest disadvantages of the older type of horizontal enlarger—the kind with no movements provided for in the negative carrier—is the difficulty of framing or recomposing the picture on the easel, unless the latter has very elaborate rising and falling, tilting and twisting movements, and therefore is mechanically complicated and expensive.

The writer considered the problem of overcoming this snag for a long while before he hit on the idea of borrowing from engineering practice to the extent of using a "magnetic chuck" to hold the easel-board in place. The "magnetic chuck" grips a piece of sheet iron screwed to the back of the easel in such a manner that although the latter is held in place very firmly, without possibility of slipping or falling by force of gravity, at the same time the easel may be slid up, down or sideways—indeed, in any direction at will—by just pushing against the force of the magnet. The ease and convenience of this movement must be tried to be appreciated.

The essential part of the device is the magnet, which is one removed from a broken permanent-magnet loud-speaker of the "midget" type. Such magnets are often to be obtained from radio and "junk" shops. The piece of sheet iron may be of any size to provide the required degree of movement—say eight inches square—but it must be 1/16th in. or more in thickness. If the iron is too thin, the grip of the magnet will not be sufficient to support the easel. To provide a tilting movement, the magnet may be attached (by any means suitable to its exact shape) to a block of wood pivoted to the upright, as in the sketch.

Finally, the sheet iron must not be galvanised or otherwise coated, nor must it have any oil on it—otherwise the easel may slip. Conversely, if the action is very stiff, the merest trace of grease on the iron will remedy this. The easel itself, of three or four ply wood, is screwed or otherwise fixed to the sheet iron and may be fitted with glass front, masking device, etc., as required. R. H. McCUE.

*Only Lantern Slides reveal all the artistry
of your pictures . . .*

Project them with an

Ensign OPTISCOPE

If you have never seen a picture of your own as a lantern slide you will be surprised at the way the beauty is revealed. In fact, the quality of a picture has never been properly appreciated until it has been projected.

Think of the enjoyable winter evenings you could spend showing your favourite pictures to friends and family, reviving all the happy memories of summer scenes and pleasures.

An Ensign Optiscope is equally suitable for monochrome slides or colour transparencies. No fitting-up is necessary—just plug in to the nearest socket and fix up a screen 4 to 5 feet square.

Make your own slides

With an Ensign Slide Making Outfit lantern slides can be produced simply and as easily as a contact print. Everything is provided in the outfit to complete the finished slide (except actual lantern plates), including printing frame with guides for

Leica or Contax ciné negatives in strip, negative masks and glass, packet of 12 combination cover-glasses, and 12 masks for either Leica, $2\frac{1}{4} \times 2\frac{1}{4}$ or half "20" size 5/6

Ensign Optiscope No. 6a is equally suitable for black-and-white or coloured (Dufaycolor) pictures mounted as slides. Embodies many practical features and is designed for use at home or in small halls, having a throw up to 30-40 ft., at which distance a brilliant 9-10 ft. square picture is obtained. For home showing a smaller picture is preferable and at 15 ft. it measures approximately 4-5 ft. wide. With ALDIS UNO Projection Lens, 8-in. or 10-in. focus **£10 10 0**

Ensign Optiscope No. 9a is provided with long-range extension and will take lenses up to 18-in. focus. It is for use at any distance up to 60 ft., giving a 12-16 ft. square picture according to the lens used. With ALDIS UNO Projection Lens, 8-in. or 10-in. focus **£15 15 0**

Ask your dealer for a copy of latest brochure "Project Summer into Winter with Ensign Optiscope," or write to ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1.

Greatest End of SUMMER SALE

A few second-hand "PHOTOSKOP"™ ELECTRIC Exposure Meters

The Photoskop is entirely automatic, and in no way dependent on the human factor. It indicates the correct exposure without reference to tables, after setting it to the Scheiner speed of the materials to be used.

List price £5 5s.
To clear, post free **£2:2:0**

THE LEICA MANUAL

Here is a book which represents the accumulated experiences of 22 specialists in Leica photography. No other book has ever attempted to cover the broad scope of Miniature Camera photography as thoroughly as the *Leica Manual*. 500 pages, 350 illustrations. A few copies of the 1936 Edition, to clear at....

15/-

Postage 6d. extra.

500 AUTO-TIMERS

This is one of the neatest and most efficient self-timers on the market. It releases the shutter fifteen seconds after it has been set going, allowing the operator ample time to be included in the view or group it is intended to photograph. It can also be set to give automatic exposures from 1 to 12½ secs. duration, with automatic release.

List price, including leather case, 14s. 6d.
OUR PRICE 8/6
Postage 3d. extra.

PORTABLE "FLOODLIGHT" REFLECTOR

For use with 200-watt Nitraphot Lamps.

Screw cap fitting. Can be hung from a wall or stood on a table or other support. The reflector can be adjusted to any desired angle. The lamp-holder is made of bakelite and takes lamps with screw-cap fitting only. Complete with 6 ft. flex and wall plug fitting. Can be used from a lamp-holder by means of an adapter.

PRICE 5/-

Postage 6d. extra.

35-mm. FILM DEVELOPING FRAME For Contax, Leica, Retina, etc., Film.

Simplifies the processing of Leica, Contax, Retina and all 35-mm. films of similar length. The film, emulsion side out, is wound on the frame and placed in any 10" x 8" developing tray with sufficient solution to cover the film.

To clear **7/6**
Postage 6d. extra.

FLOODLAMP REFLECTOR

A reflector designed for use with Photoflood lamps. By using the switch on the base of the reflector the "life" of the lamp is economised—it need not be switched on until all is ready for making the exposure.

A few shop-soiled, to clear **7/6**

including 9 ft. flex.
Postage 1s. extra.

Nitraphot Photoflood Lamps,
2s. 6d. each.

Please state voltage when ordering.

"DIST" DISTANCE METER

The "Dist" Distance Meter shows exactly the distance of the subject from the camera. The range of the instrument is from 1 ft. 3 in. to 50 ft. Complete in hand-sewn leather case. List price £2 10s. Shop-soiled Model, 35s. 0d.

GRAVURE EN- LARGING FRAME

The Gravure Enlarging Frame will give enlargements a unique distinctiveness, so that they will cease to be "just photos."

It enables a variety of novel and extremely beautiful effects to be easily produced on ANY enlarging paper and with ANY vertical enlarger. For 10" x 8, 8½" x 6½" and 6½" x 4½ in. enlargements.

Complete with 3 Printing Screens and 3 masks. List price £2 2s. **£1:5:0**

To clear Post free.

THE ONE-HAND CAMERA HOLDER

Here is a most ingenious and handy attachment for hand camera users. Made of chromed wood and fitted with tripod screw and rubber washer, this one-hand holder can be used with any hand camera provided with a bush for tripod screw. For English or Continental cameras.

List price 3s. 6d.
To clear **2/3**
Postage 3d. extra.

A Few Second-hand 'PRINSEN' ELECTRIC EXPOSURE METERS

The "Prinsen" Electric Exposure Meter is the simplest exposure meter controlled by a photo-electric cell. Carried easily in the vest pocket, the "Prinsen" needs only one simple adjustment to the H. & D. speed scale for the plate or film to be used.

List price £3 8s.
To clear, post free **£2:2:0**

Including Leather Case.

ELECTRIC DARK-ROOM LAMP

An Electric Dark-room Lamp with revolving front, showing ruby, yellow or green light. Can be used either flat on the bench or hanging. Complete with 3 ft. flex and frosted electric lamp. List price £1 1s. Price, to clear stock **10/6**
State voltage when ordering. Post free.

SETS OF "RHACO" FILTERS

Made of coloured optical glass which does not fade. Each set contains clip-on Rhaco Holder which allows of filters being easily interchangeable, and 3 yellow filters, 2x, 4x and 8x, complete in case.

To fit on lenses:
1½ to 1 in., 15s. 0d. for 7s. 6d. 1½ to 1½ in., 26s. 6d. for 13s. 3d.
1½ to 2 in., 40s. for 20s. 0d.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

AMATEUR DRAMATICS and the Miniature

WITH the approach of winter, social activities in the small provincial towns begin to take shape in the hands of the various organising committees. Of these, amateur theatricals provide the principal attraction to us as amateur photographers. Rehearsals are now commencing, and shortly the productions, together with other social events, will furnish throughout the winter an intensely interesting side of his hobby to the enthusiastic amateur photographer equipped with a modern miniature camera and an $f/2$ or $f/3.5$ lens.

The Camera at Rehearsals.

Particularly if he is a member of the producing company, the camera can accompany him to rehearsals and behind the scenes—though at all times it must be remembered that the photography is a secondary consideration and must never interfere with the work going on.

For example, the writer and his wife, rather musically inclined, have belonged for some time to a provincial amateur operatic company, and to the sheer joy of the Gilbert and Sullivan evergreen humour and captivating refrains is added the pleasure of recording the various productions with a series of exposures made from the wings or "in front."

From other members of the Company there is always a keen demand for prints, and the writer makes a practice of handing his negatives to a

LARNE AMATEUR COMEDY COMPANY IN "THE LILIES OF THE FIELD."
 $\frac{1}{2}$ sec. at $f/4.5$; taken from the Gallery.

LARNE AMATEUR COMEDY COMPANY IN "THE MIDDLE WATCH." $\frac{1}{5}$ th sec. at $f/3.5$, I.S.S. film.

good D. and P. firm to fill the orders, though some amateurs with more time at their disposal might prefer to do the work themselves. One soon acquires a reputation, and other productions in the town give the photographer a hearty welcome, in most cases forwarding a couple of complimentary tickets for seats with an excellent view of the stage.

The local Press, too, welcome a print or two and pay the usual reproduction fees. When a newspaper man attends a production it is generally at the dress rehearsal to make exposures on poses arranged by the Company and the resulting pictures compare most unfavourably with those taken during the actual performance. They appear stiff, and often tend to give a wrong impression of the quality of the show.

Apparatus and Exposure.

Turning to the technical side, the Leica is the camera preferred by the writer, preferably with an $f/2$ or $f/2.5$ lens, though good work of a more limited nature may be done with apparatus equipped with $f/3.5$ or $f/4.5$ lens. At the latter aperture it has been found possible to make good negatives with a $3\frac{1}{2} \times 2\frac{1}{2}$ folding camera, photographing from the wings, and steadying the camera against an adjacent piece of scenery. The exposure given was one-half second during "applause moments," when poses are held for a few seconds.

"AMBROSE APPLEJOHN'S ADVENTURE." $\frac{1}{20}$ th sec. at $f/2.5$.

A tripod, of course, is out of the question owing to the usual lack of space behind the scenery on a small stage.

From the Wings.

Assuming then that the photographer is a member of the Company, familiar with the action, the stage is carefully surveyed for a point in the wings which will provide as good a view as possible, with freedom from glare of opposite lighting, and on the opening night the camera in its case is "parked" as close to that point as can be arranged.

It is quite a simple matter then to make exposures between appearances on the stage, especially when one is simply a humble member of the chorus. It is also possible to visit the gallery at times, and a seat kept vacant in the "stalls," into which one could slip for a time, enables the performance to be fully covered.

Exposures at $f/2.5$ will vary between $1/25$ th second and $1/5$ th second, using fast panchromatic film, but in most small towns the light will not be up to city theatre standard, and a few trial exposures during the dress rehearsal will be of great assistance.

Development.

The writer obtains satisfactory results from developers such as Rytol, M.Q. (D.76 or standard), glycin, and the old favourite pyro-soda (non-staining formula), provided they are used in a diluted state and development is not forced. Another good developer is the old Wellington easily-remembered formula:

Metol	20	grs.
Hydroquinone	20	grs.
Sodium sulphite (cryst.)	200	grs.
Borax	200	grs.
Water	20	oz.

Super pan. film, 10 mins. at 65 degrees Fahr.

No difficulty should be found in obtaining sharp prints of P.C. or half-plate size from the tiny negatives; vigorous bromide is best, and most people prefer the prints glazed. Any copies intended for submission to the Press should be completed at the earliest possible moment and handed in to the newspaper selected first thing on the morning following the opening performance. These pictures,

of course, are of no interest to the national press, but appeal to the Art or Photographic Editor of a paper printed and circulated locally. H. W. GARLAND.

LARNE CHORAL SOCIETY IN "IOLANthe." $\frac{1}{2}$ sec. at $f/4.5$.

FROM "THE GONDOLIERS," ACT 2.
 $1/10$ th sec., $f/2.5$; taken from the wings.

Super-cleanliness and the Miniature Negative

THE first essential for the production of spotless negatives is a clean developing tank. If it has been allowed to become dirty, it and its accessory parts should be treated with a 5 per cent solution of acetic acid, swilled out with clean water, thoroughly dried with clean, damp chamois leather, and kept with the lid on in readiness for the next film. The apron, if one is fitted, should be wiped as thoroughly as possible and then hung up to dry in a cupboard away from dust.

Immediately before use, the developer is filtered directly into the tank by means of a funnel fitted with filter-paper and stuck through the opening in the lid. This and the subsequent filtering operations are greatly accelerated by the use of a large funnel of about 9 inches diameter and correspondingly large filter-papers.

The fixing-bath is likewise filtered and kept in a covered vessel until required, and the same applies also to the stop-bath, if one is to be used. The apron is then dusted with a soft leather, and the film wound on in the usual way. Development follows with the usual precautions as to maintenance of the correct temperature, avoidance of air-bells, etc. If no stop-bath is to be employed, a quantity of water can now be filtered while development is proceeding, for use as a rinse between development and fixation. After the rinse or stop-bath fixation is carried out with the previously filtered solution. Meanwhile a further supply of filtered water can be prepared for the preliminary washing of the film; the tank is swilled out two or three times with this, and then left upside down for a few moments to drain.

The temptation to look at the film at this stage should be resisted, as one of the main features of this method of working is to keep the lid of the tank in position until the film is ready to hang up to dry, thus reducing the chances of contamination by dust to an absolute minimum.

The final washing is best carried out by allowing water from

the main to flow slowly through the tank in a steady stream, again using for the purpose a funnel and filter-paper standing upright through the hole in the lid. A short length of rubber tubing or hosepipe is often useful if the tank cannot be placed directly under the tap. The continued running of the water from the tap may lead to its emerging at a temperature much lower than the usual 18° C., which is recommended for development and fixation, but if the preliminary washing is done at the correct temperature and the first of the final wash-water allowed to run through slowly, the drop in temperature will be a gradual one and should cause no anxiety.

After about half an hour the film is ready for drying and it may then be taken out and suspended by a clip for the removal of surplus water with a viscose sponge. As a last precaution it should then be taken down again, the emulsion surface examined carefully from end to end in the oblique rays of light from a reading lamp, and any small particles of fluff or dust which may have come from the mouth of the film cartridge, or from other sources not under control, can be pushed gently to one side with the finger-tip, where they will do no further harm.

The film is then left to hang undisturbed until dry. If no special drying cupboard is available, the next best thing is the spare bedroom, provided instructions are left that it is not to be entered until further notice. As development is most often done at night, there is usually nothing to fear on this score from the other inhabitants of the house.

All this may seem to be carrying the cult of cleanliness to the point of absurdity, but the technique has proved its value repeatedly, particularly where large glossy prints have to be made, and is well worth a trial by those who aim at getting perfect negatives every time. The pleasure of seeing a spotless 10×12 enlargement developing up in the dish is an ample reward for the extra trouble taken. P. S. MILNE.

Modern Miniature Cameras

THE RETINA.

THE Retina is an extremely handy little instrument taking pictures size 24×36 mm. on lengths of standard 35-mm. ciné film. Owing to its construction, which is much like that of an ordinary folding roll-film camera, and so provides a baseboard which protects the lens when the camera is closed, the Retina possesses the advantage that it can be carried in the pocket without likelihood of sustaining any damage. Its size and weight, too, are such as to tempt its owner to carry it in this negligent but convenient way; it measures only $4\frac{1}{2} \times 3 \times 1\frac{1}{2}$ in. over all projections, and weighs, loaded, but 17½ oz.

Pressure of a button placed on the side of the camera opposite the view-finder releases the baseboard, which only needs pulling gently down to lock the camera in the extended position. The lens has a focal length of 5 cm., which is standard for the size of picture, and has a maximum aperture of $f/3.5$. It is non-interchangeably mounted in a Compur or Compur-Rapid shutter, the highest speeds being $1/3000$ or $1/5000$ sec., respectively. A plunger-type release is provided, this screwing into the thread normally reserved for a wire release, by which it can be replaced at any moment if desired. The normal trigger release is retained, and is perfectly accessible, but it was found in use that of the two the plunger release, in spite of being less familiar, was the more frequently used.

For focussing, a wide collar behind the shutter is turned, either by its milled edge or by a button provided, and this operates a focussing mount which sends lens and shutter forward without rotation. The scale, which runs from "infinity" to $\frac{3}{8}$ ft., is duplicated, so that no matter whether the camera is held horizontally or vertically one scale or the other is readily visible from above. The stop scale is on the edge of the shutter just in front of the focussing scale, and is duplicated too.

The Retina is built to take the standard 36-exposure cassettes used for miniature cameras of this size. The camera is easy to load, for the back hinges open giving full access to the interior. The film cartridge is dropped into its chamber and the rewind knob pushed in to engage with it, and the free end of the film is slipped into a slot in the take-up spool. The back of the camera is now closed, the counter set to "1," and the film wound on until automatically stopped. The control for this is operated by a single sprocket which engages with the film on the side which is cut away to trim the leading end; in consequence, the first turn of the winder up to the stop winds off the whole trimmed leader and one frame more, so bringing unexposed film to the picture opening ready for the first exposure. After the first exposure a release lever is pressed; this actuates the counter and frees the winder, allowing the film to be wound on by one frame before the mechanism automatically stops again.

When 36 exposures have been made the film is rewound into the cassette. As in all cameras using the rewinding system, partly-used film can be removed from the camera and replaced with colour film or a black-and-white film of different characteristics, after which the original film can be put back into the camera and the remaining portion used.

A depth-of-focus scale is mounted on the camera, this consisting of two concentric rings so graduated that, by setting an arrow to the distance for which the scale is set, the limits of sharp focus at all stops can be instantly read off.

The Retina is available in all-black finish with Schneider Xenar $f/3.5$ lens in Compur-Normal shutter at £10 ros. In chromium plate with Kodak Ektar $f/3.5$ lens in Compur-Rapid shutter it costs £13, or £15 with an $f/3.5$ Zeiss Tessar lens in place of the Ektar. A convenient ever-ready case is included in the price of the chromium-plated models. The Retina can be obtained from any dealer, or direct from Messrs Kodak Ltd., Kingsway, W.C.2.

Miniature Camera Gossip

By LANCELOT VINING.

BETWEEN us (myself and readers) we have very nearly put paid to the proposed synchronised speed-flash demonstration. In the first place I selected 11th of November without remembering that this was Armistice Day, and as a result I was turned down over every room I tried to secure, and then you responded in such numbers that you are already nearly out of hand.

I feared a "flop," and only dared to hope that fifteen, or at the most twenty, would respond. Now I find I have sixty-nine postcards on my desk, and three phone calls were received after the last post decided upon. As a result, there must be a short postponement, and final arrangements for the meeting will be published next week.

The Editor of "The A.P." is hoping to arrange for the demonstration to take place at the Camera Club, which will, of course, be ideal, so I must ask all who sent postcards to accept my sincere apologies and be sure to get the

PHIL TAYLOR AT PRACTICE AT COVENT GARDEN.
Taken with Kalart Speed Flash.

the way he pulls up in his own length is one of the high-spots of the show. I found that unless the skaters were caught in the air there was very little evidence of real speed in the finished photographs.

Bird's-Eye View.

Earl and Josephine Leech from Texas, the dancers who introduced the "Shag" to London at the Embassy Club, presented me with a problem. They wanted 24-in. prints from their dance for their showcase; the photographs were to be taken in the afternoon, when the club is deserted, and I was not to show any of the empty tables. As the dance floor was surrounded with them, it did not leave me much choice of view, but here is my solution, obtained from one of the said tables.

EARL AND JOSEPHINE IN FAST SPIN.
Mendelsohn Gun, $1/5000$ sec. at $f/4$, I.S.S. film developed in No. 16.

final arrangements from "The A.P." next week, 17th November.

Ice Ballet.

For the rehearsals of "Rhapsody on Ice" at Covent Garden, I arrived as Phil Taylor was testing the rather small ice floor, to see if he could do his famous jumps without finishing in the orchestra pit. The trial proved that there were very few inches to spare and

lieve that flashlight always results in a soot-and-whitewash print should look at Josephine's flowing skirt, which, in the original photograph at any rate, is full of detail and fine gradation. Exposure, of course, has to be right, but at bottom it is all a matter of development and developer. And I must say I think this result says a good word for my new developer, which I am going to call No. 16.

TEN GUINEAS AND UNDER

Inexpensive Miniature.

Miniature versus Reflex

By
W. E. BALL.

SINCE I acquired my miniature—a 4.5×6 cm. Korelle-P camera for plates—I have discovered that it has several points of advantage over the 3½×2½ reflex which has been my companion for the last twenty-five years.

Focussing in artificial light with a reflex is difficult, as the image is so poorly lit; I have often had to hold a lighted match and focus on the flame. But with the scale focussing of the miniature this trouble does not arise.

Scale focussing I found useful on an occasion when I took an interior "self" portrait. The only place in the room where the camera could be stood was a narrow window-ledge; I put the Korelle there, set the focus and the shutter and pointed the camera at the seat I was to occupy. The amount of the view taken in by the lens did not concern me, as in any case I intended to enlarge only the essential part of the negative. All I had to do was to start

SELF-PORTRAIT.

Taken as described in the text.

placing within my reach many subjects that would have been, in practice, impossible with the reflex. Its inconspicuousness enabled me to take the accompanying photograph in St. Paul's Cathedral, merely by resting the camera on a stone ledge, quite unobtrusively. It was taken during the midday lunch hour, and my only anxiety was to choose the moment when no one was walking across the field of view. It was my first experiment in this line, and shows what are the possibilities. Only a miniature camera could have been used under such circumstances, for can you imagine yourself walking around St. Paul's with a bulky reflex?

One way and another, my miniature undoubtedly earns its salt.

ST. PAUL'S CATHEDRAL.

4 secs. at f/4.5, S.G. Pan. plate.

the delayed-action mechanism buzzing, and sit down to wait for the click.

But the reflex would have been useless; the window-ledge was far too narrow for it to stand on, and in any case I could not have got behind it to focus.

Incidentally this "self" portrait, with which the reflex could not have coped, led to four more portraits being taken of other sitters in similar positions, and they sold readily.

The possession of a miniature camera has been responsible for

OFFICE-WORK.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

OLYMPIC CAMERA.

Can you tell me where I could procure an "Olympic" camera? It is a miniature camera made, I believe, in Japan, but although I know there is an agent in this country, I cannot trace his address.

C. R. W. (Morayshire.)

We much regret that we cannot give you the information for which you ask, as we have never seen the camera you name. It is made, however, by Asahi Bussan G. K., Ginza Nishi 8-chome, Kyobashiku, Tokyo, Japan, and if you address a query there you will doubtless be informed as to the source from which the camera is obtainable in this country.

ENLARGING WITHOUT ELECTRICITY.

I want to begin enlarging my own miniature negatives, but have no electric light. Could I expose my enlargements at a friend's house and bring them home for development? Or can I get an enlarger that works with an illuminant other than electricity?

L. H. S. (London.)

You cannot make your exposures and then pack, remove and develop them at your own house, as you appear to have overlooked the important fact that test strips must be developed first in order to arrive at the correct exposure required for the final print.

Your second proposal is the more sound, and we advise you to write to Messrs. J. Lancaster & Son, Ltd., 54, Irving Street, Birmingham, 15, who make an enlarger for use with gas, which we presume is what you have in your house.

UNDER-EXPOSED FILMS.

I have to develop a series of 36-exposure films, some being Panatomic and some Isopan F.F., and have so far developed but one, using a special fine-grain developer. It seemed quite badly under-exposed, and I am wondering if you can tell me what developer to use to obtain the best fine-grain results from the remainder.

W. D. W. (Cheshire.)

Either Panatomic or Agfa F.F. film will give very satisfactory fine-grain results if developed in an ordinary M.Q.-borax developer such as D.76, and as no extra exposure is required for this developer, we think that, by using it, you will be getting as good results from your under-exposed film as you can hope for.

LENS FOR ENLARGING.

I have two old plate cameras, one with a 5-in. Cooke Luxor f.6.8 and the other with a 4½-in. Ernemann Detektiv Aplanat, also f.6.8. Would either of these lenses be suitable for enlarging V.P. negatives to a maximum of about seven diameters?

M. A. V. (London.)

The Cooke lens that you mention is an anastigmat, and therefore very suitable for enlarging, whereas the Ernemann lens is of the rapid rectilinear type, and will not give quite such good definition. The Cooke lens is of unnecessarily long focal length for enlarging from V.P. size negatives, but if you do not mind the inconvenience of a rather long distance between lens and bromide paper, you will find that it has no other drawbacks.

EXHAUSTION OF DEVELOPER.

Using such a developer as D.76, how many films can I safely develop in each litre of solution? Is there any formula by which I can compute the number of square inches of film that a given amount of developer will treat?

G. R. H. (Nuneaton.)

There is no possible means of fixing a maximum area of film that a given amount of developer can develop satisfactorily, because a fully exposed film exhausts the developer much more rapidly than one that is under-exposed. You may, however, take it as a rough guide that 3 grains of developing agent (metol, hydroquinone, etc.) should satisfactorily develop not less than 12 square inches of negative, or that 1 gram will treat about 400 square centimetres. A litre of D.76, which contains 7.5 grm. of metol and hydroquinone, will therefore develop about nine 36-exposure rolls of miniature film.

PHOTO-CELL METER BY ARTIFICIAL LIGHT.

If panchromatic films have several times their normal speed when used with artificial light, how do I use my photo-cell meter for taking portraits by Photoflood light? Do I give less than the meter indicates?

R. J. L. (London.)

When using a photo-electric exposure meter by artificial light it is generally satisfactory to give to panchromatic film the exposure time indicated by the meter, but when using orthochromatic film it is usually necessary to increase this exposure by about three times.

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDXI.

Mr. NOEL
GRIGGS.

From information communicated to our Special Representative.

"TO create something that has beauty must be the ambition of all serious photographers, myself among them. To this end I strive for perfect composition, lighting and texture, all of which add their quota to the result in varying degrees, but are not sufficient in themselves, for to these one must add the æsthetic or vital quality to make the picture 'live.' In the case of a portrait, one looks to facial expression; in landscape, one of Nature's many moods must supply the quality.

"If the subject itself is not a perfect specimen for

a picture (and in my case the choice is not always mine), then I try various lightings, or maybe points of view; or is it texture that must be emphasised to get what is required? Simplicity of lighting and composition is generally my aim. I have no definite formula for either, except the usual fundamental principles required for a picture, and if to this end one light is sufficient then I prefer to leave it at that.

"I always get a first thrill when composing the picture on the screen, or in seeing it revealed before me; a second one on seeing the negative developed, and a third one when either masking the print or seeing the subject enlarged on the enlarger table; but generally I find that I make a complete composition on the screen or finder.

"I use any type of camera and apparatus appropriate for the subject; a miniature or quarter-plate reflex for rapidly-moving subjects and tight corners, and a stand camera of any size up to 10×8 in the studio for quiet figure work or still life.

"For negative material I mostly use panchromatic plates, and pan. films for smaller size, developing in normal M.Q. tank developers, occasionally using a non-grain developer for the smaller negatives. With the exception of judicious shading, prints for the most part are 'straight' from the negative and generally printed on a white semi-matt paper. Mounting, too, I prefer to be as simple and light as possible, believing that the picture should 'stand on its own legs.'

"I find interest in everything that moves and everything that is motionless, whether human or mechanical; and I like the adventurous feeling that the picture I'm after might be round any odd corner; but quite often one finds it there when the camera is miles away, of course.

"The grapes and glass picture reproduced elsewhere is the result of an idle moment; both elements had been used in the studio some days before, the grapes looking rather the worse for wear on this account."

(A further example of Mr. Noel Griggs' work is reproduced on one of the centre Art pages.)

APPLE PEEL.

Noel Griggs.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"SUNBEAMS," by H. R. Martyn.

HERE is a picture that shows us that even now, with the colder weather coming on and unfavourable conditions becoming more prevalent, there are still many opportunities for making promising exposures out of doors. With the onslaught of autumnal mists, atmospheric conditions, particularly when the sun is just breaking through, are such as to favour picture-making in both town and country, for the mist tends to show an unusual aspect of such subjects and veils much of the assertive detail that disfigures them in ordinary circumstances.

Imagine this scene as it would be without the softening effect of atmosphere. Instead of receding gracefully into the distance, the wall on the right would be of practically the same weight towards the centre as it is at the right-hand edge; the elevated passage-way joining up the right- and left-hand sides would be almost as dark; the roof would not be so heavy, perhaps, but it would be a good bit darker in its general tones, and its internal contrast would be greater; and the farther space beyond would be clear-cut and well defined, while its tone, also, would show a greater depth. If sunlight were also present, it would be more brilliant than now; the beams would scarcely be perceptible; and, compared with the present rendering, the impression would be harsh and too assertive in its contrasts, unless, of course, suitable steps were taken to modify them.

But, assuming that this were done, the impression would remain clear-cut and fully detailed, and could not approach the soft and engaging mellow feeling there is in this impression. From this arises its greatest charm, and now is the time to go out and get themes of a similar nature.

As far as arrangement is concerned the figure (1)—half in sunlight and half in shade—supplies the dominant note and acts as the centre of interest. Her importance is stressed by her strong placing—her figure comes near

and almost on one of the intersections of divisions of thirds—and by the emphasis afforded by the lines of the beams of sunlight falling from the top right-hand corner.

The line of the pavement, too, serves a similar purpose, and so do the splashes of sunlight on the roadway in the near vicinity. The darker notes of the two figures near also stress the touch of brightness on the dress of (1) and the three form a quite

in the picture space, it does not attract any attention to itself, it is of appreciable importance in setting the scale by which the lighter and more delicate tones elsewhere are to be estimated. It is this dark that gives them their value. It could be wished, perhaps, that its great length could have been relieved a little by a greater hint of modulation, but it cannot be dispensed with, as covering it up immediately shows.

On the opposite side, it is balanced by the weight of tone in the back of the van, and a very useful connection, which helps to establish the unity of the composition, is provided by the bridge in the middle distance. A very necessary sense of stability is conferred by the depth of tone in the immediate foreground, and, taking it all round, the arrangement holds together and makes up very well.

As a general rule, I like to see the chief figure in a front view, rather than in the act of going away, but in this instance I do not think the rear view has any ill effect, and, indeed, there is some virtue in the fact that the direction in which the figure is moving seems to indicate the distance where all the lines seem to merge and lose themselves. In this an impulse towards unity is created which is all to the good.

The real attraction of the work, however, rests with its excellent feeling of soft and mellow sunshine combined with a suggestion of atmospheric mist. That impression is appreciably enhanced by the presence of the shafts of sunlight—an effect which is rarely caught—and the whole provides a very pleasing theme in every way.

Once again, the transformation arising from the incorporation of these two effects has made a picture of what, in normal circumstances, would be a most uninspiring theme, and, yet again, the contention that pictures lie all around for those with eyes to see them is conclusively demonstrated.

"MENTOR."

effective group. The more distant and shadowy figures and vehicles beyond are barely perceptible, and do little more than help the atmospheric suggestion, while the lines of perspective, leading up, as they do, to an open space beyond the roofed-in portion seem yet further to enclose and accentuate the group in question.

They are, more or less, framed in this patch of lighter tone and derive a considerable emphasis in consequence. On the extreme left there is a vertical stretch of strong tone—the heaviest in the picture—and though, owing to its weak position

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

QUITE a considerable proportion of the prints that are reproduced from time to time on the opposite page are subject to the disadvantage arising from a miscalculation of the viewing distance. Either the point of view is too near and the subject is shown on too large a scale, or it is too far off and has to be trimmed to exclude those portions which are not required.

Viewing Distance.

Of the two defects, the latter is to be preferred, and, at times, it may prove exceedingly useful to have a margin to play about with, but, with the former, it almost invariably happens that the subject is spoilt and there is nothing for it but retaking.

With No. 1, "Haymaking," by J. S. Clementson, the fact that the horse's nose is cut off indicates that the point of view was too near, for, quite obviously, so much of the animal would not have been shown had the intention not been to include the whole. It may be, perhaps, that the idea was to incline the camera more to the right and to show the horse and wagon placed more to the left—an arrangement that would just about permit the lot to be included—but, either on account of the direction not being held or possibly through the indication of a faulty view-finder, the intention has miscarried and the subject is done for.

Nor, unless it should be the case that there was no room to get farther back, is there any need to take a scene of this kind from a point so near. It is one that could do with a fair amount of space all round, and, had it been taken from a stance about fifteen to twenty feet farther away, the horse and cart with the accompanying figures would be shown with something like a margin of half an inch on each side.

Space and the Subject.

The group would be smaller, but it would be none the worse for that, and a margin of space would be available for manipulation if required. But, as it happens in this particular case, quite a satisfactory arrangement can be made—more by good luck than good management—by eliminating the horse altogether and simply including the two men and part of the wagon.

That means trimming one inch of the right-hand side away, and, incidentally, turning the picture into a vertical instead of a horizontal. It may be very small, but the composition makes up acceptably enough, and, if the size does not appeal, recourse may be made to enlargement.

With No. 4, "Three of a Kind," by Leslie Murray, a similar state of affairs is revealed, for the tip of the uppermost ear of the kitten on the left is cut off, and there is a sense of restriction arising from the lack of sufficient space in the setting. Increasing the viewing distance by so slight an amount as a foot would have enabled the fault to be avoided, and, having regard to the high technical standard otherwise exhibited, I am rather surprised that the drawback was overlooked.

Difficulties and Drawbacks.

This is a print in which there is no misjudgment in focussing, no error in exposure, for the shadows are full of modulation and it has been short enough to counteract visible movement of the image; development has been properly conducted so that the tones of the negative are all reproduced in the print; the print itself does not betray any technical deficiency, and the subject is caught extremely well. Yet it is spoilt by so slight an oversight that even the veriest beginner might not have passed it over!

On the other hand, No. 3, "At the Sink," by F. C. Croft, is a subject that is very well spaced indeed. I do not think I should be inclined to make any alteration as far as the placing of the figure or its proportion to the picture space is concerned, but I am afraid its technique is not up to the standard of No. 4.

Admittedly the subject is one of no little difficulty. Its contrasts are far greater than the normal run, and, though some allowance seems to have been made—either by reducing the time of development of the negative or by the employment of a softer kind of paper than usual—it is not enough, and a considerably softer grade of paper still is needed to bring the tonal scheme into harmony.

It is not improbable, however, that a measure of under-exposure is also

present, and, if so, nothing can correct the defects—lack of shadow modulation—that arise from this cause.

Range and Scale.

Nevertheless, the nature of the subject is such that a minor degree of under-exposure, and consequent absence of form in the very darkest portions, is not very material, but there should be rather more distinction of tone in the lighter portions, which are sufficiently exposed, and these the softer paper would provide, without over-printing those portions which should be shown in various degrees of half-tone.

What I should expect from the substitution of papers is, amongst other things, more tone in the band of the cap as it goes from the front to the back of the head; a lightening of the shadow on the cheek; more tone in the front of the apron; and a less abrupt transition from light to dark in the arms. The back of the skirt should also be more clearly seen, but, unfortunately, it is also likely that the bottles and implements in the rear would be rendered in a lighter shade and become more insistent than they are at present.

These, I feel, might be subdued by local over-printing or retouching on the print, the idea being to centre the attraction on the figure, but care would have to be taken that the working-up was not detectable or its object would be defeated.

Still Life.

No. 6, "Onions," by P. R. Shindle, is a still life with quite a good idea of arrangement, but, like No. 3, it is spoilt by excess of contrast. The tone values are wrong.

The same remedy—a softer type of paper—is indicated, but the two outdoor subjects, Nos. 2 and 5, "Drum Inn," by A. S. Brown, and "Traffic in Tunisia," by Mrs. H. Rounthwaite, present a more harmonious tonal scheme, so that the paper may be regarded as suitable for the negative. The sky of No. 2 is rather deficient in tone, but the workmanship is good in other respects, and while No. 5 has a better rendering of the sky, it could do with more strength in its lower reaches.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

THE BEST STOP TO USE.

IT is rather unfortunate that I have to put some sort of title to these notes each week, because I seldom stick to my text. I prefer gossiping to preaching; and in this note I am going to refer to other things besides stops.

Beginners frequently ask which is the "best" or "right" stop to use for this or that subject. Although it sounds like sarcasm the correct answer is that the stop to use is one that gives us the result we require, if it is possible, and this may mean any stop from the

largest to the smallest. A few words about the illustrations may throw some light on the matter, although the spool from which they are taken was primarily intended for another purpose.

Figs. 2 and 3 are versions of the Poets' Memorial at the bottom of Park Lane, of which I have records by day and by night, including tele-photographs. It is curious how few Londoners seem to know it. Yet it has been there a long time, and it was newspaper correspondence about its neglected and dilapidated condition that led me to go and examine it again.

As the original photographs show, it is by no means a ruin. Shakespeare's breeches certainly need overhauling, but on the whole there is nothing much the matter. One of the newspaper grumbles was that the poets are not named, but no one would be likely to worry about dilapidation who could not identify Shakespeare, Milton, and Chaucer. The lady with wings, laurel wreath and trumpet is Fame, but I have no information about the others.

You are quite justified in asking what all this has to do with stops. But now we come to the point. On one side of the fountain basin is the little drinking fountain shown in Fig. 4. (Someone made an exhibition print of it long ago.) To take this I focussed at 12 ft. and gave 1/10th of a second at f/11.

The whole of the

Fig. 1.

Fig. 2.

fountain and its immediate surroundings is perfectly sharp. In the ordinary way I should use this part only, but I have shown the whole print so that it can be seen that objects much farther away are not indistinguishably fuzzy.

Fig. 3.

November 10th, 1937

With the scale still set at 12 ft. and the iris at $f/11$, I walked away to the position from which Fig. 3 was taken, and gave an exposure of $1/25$ th of a second. Then I gave another, but this time with the scale set between 30 ft. and infinity. These two I meant to reproduce side by side to illustrate the disastrous effect of not having adjusted the focussing scale. But in a small reproduction the difference in definition is hardly noticeable.

Then look at Fig. 1. Distance on scale between 30 ft. and infinity, stop $f/11$, exposure $1/25$ th. The vehicles and figure are only the width of the pavement away; the panels are on the far side of the road and high up. By a slight alteration of the scale I could have got sufficiently good definition everywhere, and if the light had been good enough for $f/16$, everything would have been sharp.

Like many other cameras there is a red dot on the scale at 30 ft., and another on the shutter just beyond $f/11$. These are a suggestion for a setting that gives a good all-round result when conditions are favourable. The focal length of the lens is $4\frac{1}{4}$ in.

A "miniature" friend of mine said he could hardly remember using so small a stop as $f/11$ for hand-camera work. I told him that it was my most

Fig. 4.

common aperture years ago, even when sensitive material was so much slower. The ordinary lenses of those days required stopping down to give marginal definition.

It is possible to use a much larger stop now, especially with short-focus lenses and range-finders. But many use a very large aperture simply

because it is there, and speed up their shutter accordingly. The beginner should understand that he can often use $f/11$ or $f/16$, and this will help him to get depth of definition, and to compensate for errors in focussing when he has to estimate his distances. But more of this later.

W. L. F. W.

Enlarging without an Enlarger

By "TYRO."

IN these days of modern photography when the processes and apparatus used by amateur and professional alike have reached the last word in perfection, it is often refreshing to delve amongst literature relating to those early efforts which collectively are responsible for the photography we enjoy to-day. To many amateurs this article may be novel, interesting, and to some extent useful.

Actually, enlarging without an enlarger consists of a process for stripping the film from a negative (which, of course, must be unvarnished) and attaching to a larger glass, the enlargement taking place during the process, which, by the way, dates from the year 1882. The following mixture is required for stripping:—

Hydrofluoric acid ..	1 drm.	(31 c.c.)
Citric acid ..	$\frac{1}{2}$ oz.	(125 c.c.)
Glycerine ..	1 drm.	(31 c.c.)
Acetic acid ..	$\frac{1}{2}$ oz.	(125 c.c.)
Water ..	4 oz.	(1,000 c.c.)

Great care must be taken in handling the hydrofluoric acid. Since it attacks glass, the acid or any mixture containing it must be kept in wax bottles, rubber containers, or glass bottles which have first been coated with wax inside.

The negative is placed in the stripping solution and the film will gradually become released from the glass and at the same time enlarged. If necessary the film can be assisted to leave the glass by the use of a camel-hair brush. It is then carefully rinsed in water and floated upon and squeezed into contact with a cleaned glass of the required size. By this means a $2\frac{1}{4} \times 3\frac{1}{4}$ size may be expanded to fill a quarter-plate, a quarter-plate to half-plate, and other sizes in proportion.

It is, of course, obvious that films enlarged in this manner give slightly thinner results, and a rather dense original is therefore advisable. Another point to remember is that the stripped film when in contact with the new and larger glass, must be allowed to dry naturally.

In the case of negatives where enlargement is not required the hydrofluoric acid is diluted with methylated spirit to counteract the tendency to expand, in which case the following solution is suitable:—

Methylated spirit	5 oz.	(1,000 c.c.)
Water ..	$1\frac{1}{2}$ drms.	(37.5 c.c.)
Glycerine ..	$1\frac{1}{2}$ drms.	(37.5 c.c.)
Hydrofluoric acid	$1-1\frac{1}{2}$ drms.	(37.5 c.c.)

To ensure that the stripped film adheres firmly to its new base this should be coated with a solution made up as follows:—

Formalin ..	10 drops	(1 c.c.)
Gelatine ..	4 grs.	(4.5 c.c.)
Water ..	2 oz.	(100 c.c.)

Transfer the wet film after stripping and washing to the new glass coated with the above solution, press down and allow to dry naturally. A fixed and washed dry plate can also serve as a support.

Films are removed from celluloid supports in the same way as those from glass, and may be treated by either of the foregoing methods for enlargement. At any rate the use of either may be tried with interesting results. The process is of especial value when it is desired to save a glass negative that has accidentally become cracked or broken. So long as the film is intact—and it usually is—there is still hope of giving it a new lease of life on a fresh support.

This form of enlargement offers considerable possibilities to the user of the modern small camera and for the fine-grain negatives obtained with it. A dense negative enlarged to double size is a much better proposition for enlarging.

MAKING BETTER SNAPSHOTS-23

By DAVID CHARLES.

This article is the twenty-third of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

FIG. 1. STORM BREWING.

Snapshot of cloud effect seen in an ordinary London suburb. Whatever the "landscape" may be like, the sky can be as fine as in the most picturesque surroundings.

FIG. 2. CLOUDS AT PLAY.

To have a camera ready loaded is essential to secure these rapidly-changing effects.

FIG. 3. SUNSET ON A SLUM.

Without the sky, and in daylight, one would hurry away from this ugly huddle of sheds. But with an evening sky like this not even Turner himself would ignore it.

MANY of my readers will be in complete agreement with a young friend who happened to see last week's pylon pictures in the making. "It's all very well," he said, "for you to advise those whose neighbourhoods simply teem with these steel towers and what-not to make pictures of them when there are clouds about. But what about us city folk? We work among office buildings, and sleep in suburbs. Just roof-tops. What can we do?"

Why, photograph the roof-tops, of course. Remember it is the treatment, not the choice of subject, that makes the picture.

The Ever-changing Clouds.

Roof-tops are everywhere, but clouds must be captured when they are there. It is astonishing how rapidly the character of clouds changes even while considering which to select, and how best to "compose" them in the viewfinder. Most certainly the photographer of clouds needs to keep a camera ready loaded with film to be prepared when the opportunity arises. Preferably, of course, with panchromatic film, especially if he goes after the very striking but definitely yellowish effects to be obtained around sundown.

These effects can be quite well obtained with a snapshot camera if it is used on a stand and the clouds are not moving too fast.

When to Use a Filter.

Even clouds in the sky can be under-exposed. A filter is desirable when brilliant blue background daylight clouds are the subjects, but towards evening, if the clouds are moving in the wind, one must weigh the balance between possible movement of those clouds and

the exposures which the shutter will give. A fiftieth of a second with a "two-times" filter brings the effective exposure down to the value of a hundredth, which is still plenty for noonday, or even too much for a bigger stop than f/8.

In the Evening Light.

But towards nightfall, which is early these days, even the sky light grows dim, and the shutter of the snapshot camera with its smallish stop may be a little too fast to allow of using a filter. Then a tenth of a second with fast film at f/8, or a "click-click" over of the snapshot camera set at "time" may be required, especially if the cloud effects are greyish or yellowish and not brilliantly white.

It is essential not to over-develop negatives of clouds, for that is almost certain to destroy their more delicate shadings. It is in these, almost as much as in the configuration, that the beauty of cloud pictures consists. For that reason it can scarcely be expected that the reproductions will convey a really adequate idea of the admiration and gratification which follows from the production of these effects. Certainly it is photography, more than any other graphic art, which can perpetuate on paper the infinitely varied arrangements of graduated tones that cloud effects consist of.

Care in Printing.

But then, again, one cannot just "dash off" prints of these with the ease of ordinary snapshots. Each one requires care to get it just the right depth and to prevent blemishes. These delicate areas of greys are just the thing on which to test the perfection of one's processing craftsmanship.

Fig. 4. The comparative pair show how too dense a negative, or lack of care in making test strips in printing, will fail to produce the sky values.

*A*mateureur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Ensure Successful Shows By F. R. UNDY.

THE home cinema really comes into its own in winter. When the weather out of doors is cold and wet and altogether uninviting, it is good to be able to open up one's apparatus and enjoy a film in the warmth and comfort of the sitting-room.

Apart from such occasions as these, however, it suggests itself as the ideal means of keeping guests happily entertained at party time, for when the more strenuous activities common to such gatherings begin to prove a little tiring, an hour or so of movies provides just that pleasing break which will carry the evening along to complete success. Yet again, there is a real pleasure at this time of the year in arranging special projection nights, with the show itself the big central feature.

The Essentials for Success.

While attention to small details may not be so necessary with those private spur-of-the-moment exhibitions, the presence of guests naturally makes one anxious to have the whole thing absolutely first class. Faultless projection, a comfortable audience, and an attractive programme—those are the essentials for a successful ciné show.

Getting a good programme together will be an easy matter. Films you have made yourself will be sure of a warm reception, provided you do not repeat them on every occasion. This, indeed, should not be necessary if you are a regular ciné camera user, for you will turn out a regular supply each year, and by presenting them in small doses—supplemented by library films—it will be possible to spread them over quite a number of shows.

Arranging the Programme.

As regards the order in which the films are shown, probably the best arrangement is to work off the smaller ones—including your own—first, then allow a two-minute break so that the audience can get their cigarettes alight and settle down, and finish off with the longest picture on your list.

Good as your films may be, however, they will not be properly appreciated if projection is not right up to the mark, and for success in this direction you must certainly look over your apparatus to see that it is in good working order.

Dust soon accumulates in the projector, with the result that the film may get scratched and a streaky effect appear on the screen. The brush and duster should therefore be applied before any important show, but even after this it sometimes happens that the picture is

strangely out of focus at one side when it is projected. Probably this is caused by a small mass of dirt clinging obstinately to one of the film guides in the gate, and the gentle use of something blunt, such as a match-stick, may be necessary to dislodge it.

To keep the machine in smooth-running order oil should be applied quite regularly but sparingly; just a single drop at each point, and any surplus wiped away immediately.

Moisture and Mist.

Then go over all glass surfaces with a soft chamois leather, for at this season moisture readily condenses into a thin mist which will naturally impair the brilliance of the picture. Satisfy yourself, also, about the lamp. If this has been in use for a year or two it might suddenly exhaust its energies at the wrong moment, so it would be worth while to replace it with a new one and keep the original lamp for emergency.

If you have films of your own these, too, may need cleaning, and they ought certainly to be examined for weak joints and torn sprocket holes. Any defects in the latter direction can be detected

by drawing the film between the thumb and finger, gripping it by the edges with just a moderate amount of pressure. A new splice can then be made at the faulty points, while damaged perforations can be mended with small patches of film as sold by Pathé.

Cleaning should, of course, come last, but then only if the presence of dirt and oil makes it really necessary—a point which applies even more particularly to colour film. The film cleaning fluid which is sold for this special purpose should be used, a flannel pad being moistened with the fluid and the film drawn through so that both sides are treated.

Clean up the Screen, too.

Then, to complete your overhauling operations, go lightly over the screen with a soft duster. If you use a plain white cloth perhaps a wash and ironing would be beneficial; or if it is of the more substantial home-made variety the surface may have become a little discoloured, so clean it up and let it have a fresh application of paint or whitening.

Having attended to these matters,

November morning in the Park. Another phase of the seasonal film is now available for the amateur cinematographer on any fine morning in the London parks. The fallen leaves and mist tell their story, and the final touch of winter and snow only remain to complete the film that started in the spring.

see that your machine has a good firm stand, with a pad to eliminate vibration. Then—provided you focus and centre accurately, and have all reels in proper order when the big night arrives—you will have gone quite a long way towards pleasing your audiences. The pictures you show then will be clean and clear and it is very unlikely that they will be troubled by disappointing breakdowns. If the film does happen to break, however, it is never wise to make a hurried splice on the spot—the prolonged waiting period would only disturb the audience, and the hasty splice would probably be a poor one into the bargain.

The first procedure in such a case is always to get both ends of the film clear of the gate and wind on to their respective reels. Then, after rethreading,

overlap the end of the upper film with a foot or so from the lower spool and wind them carefully on to the spool together. Watch closely for a moment or two when you start your machine to see that it takes up all right, and you will then be able to carry on contentedly.

Such work as this, also the changing of reels, should be carried out with just a small light near the projector, for it tends to take the interest out of a picture if the room is flooded with light in the middle of it. Even at the beginning and end of a show my own plan is to use a well-shaded floor or table lamp as an intermediate step between the two extremes of brilliant light and darkness. Such a light is certainly more pleasing in the interval.

But when the show is on the darkness

should be as complete as you can make it, for it adds to the brilliance of the picture and it also helps the audience to become properly absorbed in what they see. The fire will be the most awkward problem. Block out its flickers as effectively as you can, but let your guests keep warm. Remember also to seat them away from draughty doors and windows, make sure that everyone can see without leaning this way or that, and place the screen at a comfortable height so that they will not go away with aching necks.

Finally, keep a detailed record of each show. By doing so you will be taking a step towards the success of the next one, for there will then be no risk of presenting a film to an audience that has already seen it.

Late Autumn in Colour By NORMAN DYER.

WITH the advent of 9.5-mm. Du-faycolor, colour film is available to users of all sizes of sub-standard film. It is probable, therefore, that many amateurs will now be trying out colour for the first time, and there is no doubt that the present is the ideal time for making a colour film.

Autumn, which has been called "Nature's annual demonstration of the art of growing old gracefully," is now with us, with all that glorious blaze of colour that simply cries out to be recorded on colour film.

It is therefore suggested that the amateur should go out into the country and make a short colour film of the autumn. Such a film need not be very long, possibly about 100 ft. when finally edited and titled would be ample; if properly made, however, it would be full of interest and beauty.

For once, the oft-repeated advice carefully to plan the film in advance may be disregarded. For this particular purpose it is best simply to take the ciné camera out, and, having selected a likely tract of country, just to go through it, either walking, or by car or cycle, and shoot anything that illustrates the

idea of autumn colour or autumn mist.

The average amateur who is confined by circumstances to shooting at week-ends will not, unless he is very lucky, be able to get any shots of rural activities, and this being so an attempt should be made to stress the theme of the peacefulness of this season. Shots of a placidly-flowing stream winding its way through the brightly-tinted woods, a thatched cottage nestling in a glen, a quiet country lane; these are the types of shots required.

In the case of the last two, which are essentially static, some movement should be imparted; this can be done by arranging that some naturally-moving object should cross the field of view. In the case of the country lane, for example, taking should be deferred until a car or some cyclists or something similar passes along.

With regard to exposure, colour film has not, of course, the same latitude as monochrome, and extra care should be taken to ensure that the exposure is correct. To this end the use of a reliable meter, preferably photo-electric, is advised.

The best lighting for outdoor colour

work is a weak sunlight, and as this condition generally obtains at this time of the year this affords yet another good reason for making a colour film at this time. The sun should be kept behind or on either side of the subject; it is undesirable to attempt any *contre-jour* shots, as these are rarely successful in colour.

It will also be found that shooting much after about three o'clock in the afternoon will not be advisable, partly owing to the weak lighting and the consequent long exposure required for the comparatively slow colour film, and partly to the low altitude of the sun and the consequent long shadows, which although ideal from the point of view of the monochrome pictorialist, are not suitable for colour work.

Finally, it should be remembered to leave about twenty feet for titles, as these should, of course, be done in colour also. White letters can be used on a coloured background, or, alternatively, letters in light pastel colours. When editing, the shots can be kept on the long side, the colour content adding to the interest, and hence to the permissible time on the screen.

Exhibitions and Competitions CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, November 30. Rules in the issue of October 27.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Folkestone C.C. Exhibition of Photography.—Open, October 23–December 4. (A. J. Stewart, 25, Guildhall Street, Folkestone.)

Fourth Canadian International Salon of Photographic Art.—Open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

G.E.C. (Coventry) P.S. 4th Annual Exhibition.—Open, November 8–13. (C. W. Crowe, G.E.C. (Coventry) Photographic Society, General Electric Co., Ltd., Coventry.)

International Salon Oval Table Society, Inc.—Open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.

Open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

Xle International Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Brederodestr, 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Aberdeen P.A. International Exhibition of Photographic Art.—Entries, January 15, 1938; open, February 5–26. (Miss Hilda N. Bailey, 63, Watson Street, Aberdeen.)

Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7–12. (T. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31; open March 7–12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)

City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday, February 7; open, March 7–12, 1938. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April, 1938. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

Scottish Photographic Federation 30th Scottish National Salon.—Entries, March 2; open, April 2–16. (Percy H. Cartwright, 52, High Street, Galashiels, Scotland.)

XVIIe Salon International de Photographie de Belgique.—Entries, April 1; open, May–October, 1938. (J. Lejeune, 70, Avenue Van Becelaere Boitsfort, Brussels, Belgium.)

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, November 10th.

Battersea Men's Inst. C.C. "Getting the Best Print from any Negative."
Bethnal Green C.C. Talk on "Still Life." Demonstration in Club Studio.
Birkenhead P.A. Kodak Lecture: "Treatment of Bromide Paper."
Borough Poly P.S. "The Isle of Purbeck (from Studland Bay to Lulworth Cove)."
Brighton and Hove C.C. "Highways and Byways of Hampshire." R. M. Fanstone.
Bury P.S. "Modern British Painting." S. D. Cleveland.
Carlisle and County A.P.S. Monthly Print and Slide Competition.
Cheltenham C.C. "Colour." Members' Evening.
Croydon C.C. "Bromesko." R. Kerley.
G.E. Mechanics' Inst. P.S. Members' Competition Evening. Prints and Slides.
Hall Green P.S. Club Competition. H. S. Rowley.
Handsworth P.S. "Wild Birds at Home." H. Wagstaff.
Hinckley and D.P.S. Demonstration on Mounting. W. K. Bedingfield.
Ilford P.S. "Modern Aids to Indoor Portraiture."
Leek P.S. "A Chat on Landscape." S. Bridgen.
Leominster P.S. Beginners' Night.
Letchworth C.C. Lantern-Slide Making. N. J. Bowyer-Lowe.
Mountain Ash C.C. One-Man Show. E. H. Griffiths.
Northallerton and D.P. and C.S. Slide-Making. T. Ambler.
North C.C. Print Competition and Criticism Competition.
Pontefract P.S. Demonstration: Oil Reinforcement. E. G. Manley.
Rochdale P.S. "How to make up your own Solutions." H. Bamford.
South Essex C.C. "Photo-Aesthetics." Lecture by A. P. Morris.
S. Suburban and Catford P.S. "Zoo Personalities." C. Roberts.
Streatham P.S. "Portraiture by Artificial Light." H. Alfred Hayes.
Worcestershire C.C. "A Cornish Tour." G. H. Goodall.
Yeovil P.S. Lantern Lecture: "The Photo Film."
York P.S. Lecturettes by Members.

Thursday, November 11th.

Royal Photographic Society. Miniature Camera Group Meeting.
Accrington C.C. Slides. "Snow Scenes" by the late J. J. Hartley.
Amateur Cinematographers' Association. Films. Bognor Regis Film Society.
Armley and Wortley P.C. "Portraiture by Flashlight and Photoflood."
Aston P.S. Mounting.
Berkhamsted and D.C.C. Practical Hints for Beginners—and others.
Blyth and D.C.C. "Children." G. H. M. Graham.
Bolton C.C. "Applications of Photography to Industry." T. Trevor Potts.
Bury P.S. "Events in English History." J. B. Statters.
Camberwell C.C. Christmas Card Competition.
Coatbridge P.A. S.P.F. Portfolio.
Greenock C.C. Colour Filters.
Hampshire House P.S. Criticism of Members' Lantern Slide Competition.
Harrogate P.S. Whist Drive.
Hull P.S. Y.P.U. Lantern Slides (1937).
Keighley and D.P.A. "Lantern-Slide Making." H. Moore.
Kentish Town P.C. "The Emerald Coast of France." G. E. W. Herbert.
Kinning Park Co-op. C.C. Portrait Night.
Motherwell Y.M.C.A. C.C. Pictorial Slides by the late W. S. Crockett.
North Middx. P.S. "Processing 9.5-mm. Ciné Film." W. H. A. Fincham.
Padstow and D.P.S. "Some Masterpieces of Photography."
Richmond C.C. "Slides, Slides, Slides (Dem. and Proj.)." G. E. W. Herbert.
Runcorn C.C. "Big Little Things." Dr. R. L. Okell.
Sheffield P.S. Whist Drive.
Singer C.C. Visit to "The Scottish Daily Express."
Smethwick and D.P.S. Ciné Show. H. A. Pass.
Sunderland P.A. "After-Treatment of the Print." G. F. l'Anson.
Watford C.C. "Bromesko."
Wimbledon C.C. "Running Commentary." A. Dobson.

Friday, November 12th.

Royal Photographic Society. Joint Meeting with Kiné Section.
Bethnal Green C.C. Practical Work.
Castleford Y.M.C.A. P.S. "Scotland and the Isle of Skye."
Dartmouth L. and D.S.P.S. Photographic Alliance Prints 1936.
Harrogate P.S. "Random Rambles of a Record Photographer."
Howard de Walden P.C. Demonstration of Cloud Printing. J. W. Picken.
King's Heath and D.P.S. Print Criticism—Architecture.
Leigh Lit. Soc. (Phot. Sec.) "The Art of the Mediaeval Wood Carver."
Leytonstone and Wanstead C.C. "Trimming and Mounting." F. D. Osborn.
Penrith and D.C.C. "Cinematography." Ciné Show by Mr. Clayton.
Photographic Trade Social C. Armistice Dance.
Southend-on-Sea and D.P.S. "Velox Printing."
Welfare C.C. Grand Dance in Welfare Hall.

Saturday, November 13th.

Royal Photographic Soc. Opening of the Exhibition of Kinematography.
Birmingham P.S. Portrait Group.
Howard de Walden P.C. Informal Criticism of Half-plate Prints.
Oldham Equitable P.S. Annual Whist Drive and Dance.
Stockport P.S. Annual Social and Supper.

Monday, November 15th.

Ashington and Hirst P.C. Chairman's Evening.
Blackpool and Fylde P.S. "Artificial Light Photography." R. Boughton.
Blackburn and D.C.C. "Oil Reinforcement." Mrs. W. Madeley.
Bolton C.C. Last date for sending in exhibits for Autumn Exhibition.
Bournemouth C.C. Print Competition.
Bradford P.S. Print Night.
Brighton and Hove C.C. Instruction Night No. 3. Enlarging.
City of L. and Cripple Gate P.S. Informal Meeting. A. F. Snell.
Darlington C.C. "How Your Camera Works." O. H. Wickstead.
Erdington and D.P.S. "A Holiday in Iceland." D. Stevens.
Glasgow and W. of Scotland P.A. "Composition." R. Eadie.
Hornchurch Evening Inst. P.S. Monthly Competition and General Criticism.
Kidderminster and D.P.S. The Kodak Wash-Off Relief Colour Process.

Monday, November 15th (contd.).

Kingston C.C. "Sidelights on Exposure." B. B. Hill.
Lancaster P.S. "The Amateur Photographer" Prize Slides, 1936.
L.C.C. Staff C.C. "Toning of Bromide Prints." B. L. Twinn.
Leeds C.C. "Finishing Prints for Exhibition."
Newcastle (Staffs) and D.C.C. "Colour Photography." H. Ellerton.
Oldham Equitable P.S. "Three Yorkshire Gems." J. B. Slatters.
Plymouth Inst. P.S. "Composition." H. G. Cogle.
Shirley S. and L. (Phot. Sec.). "Enlarging." J. H. Payton.
Southampton C.C. "To the Harz and Thuringia." K. Baker.
South London P.S. "Improving the Bromide Print." I. R. P. Hilliard.
Southport P.S. "Colour Slides of the Scottish Highlands." E. W. Hodge.
Stourbridge Inst. P.S. Judging Exhibition Prints.
Walsall P.S. Bromoil Demonstration. W. Brown.
Yeovil P.S. Print Discussion.

Tuesday, November 16th.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

CHROMIUM PLATE ON MINIATURE CAMERAS.

SIR,—Chromium plate on cameras may be a blessing to manufacturers and dealers because it probably helps them to sell their goods, but I submit that it is nothing but an unmitigated nuisance to the users. We hear a lot about "candid" camera work, but who on earth can photograph anybody unbeknownst if his miniature flashes like a heliograph every time it is moved?

Undoubtedly a chromium-plated camera is smart, and attracts attention in the shop window or show-case, but in actual use it should be as completely inconspicuous as possible.

Some cameras even have a chromium-plated end-plate, and mounted on that a view-finder with chromium plate all round the eyepiece; sometimes the user can find the view and sometimes he can't, but he can always count on having his eye dazzled and diverted by multitudinous reflections.

The right colour for optical apparatus is black, and a matt black at that. A camera so finished would not flash unwanted reflections into the eyes of either the photographer or his subject, and could be used in the theatre without making the entire cast self-conscious or bringing the huskiest chucker-out in the place running up to say "You mustn't."

Already it is almost impossible to buy any high-grade miniature without chromium plate; isn't it about time the fashion changed, so that we could buy cameras meant to be used and not just looked at?—Yours, etc.,

"MINIATURIST."

SUGAR-COATED GASLIGHT PAPER.

SIR,—If I may reply to Mr. V. P. Williams' criticism of my article on sugar-coated gaslight paper, I should like to take his last point first, since the correct time of development is in question. Mr. Williams asks whether his methods are all wrong. They are not. But they are not, in my opinion, altogether correct. To my own opinion—based on many years of experience—I would add a more authoritative statement by Mr. David Charles: "The aim should be to so expose, according to the density of each negative, that the print will develop to correct depth in from 30 to 45 seconds."

Speaking generally, a print given a shorter or a longer time is incorrectly developed. For work of perfect quality one of those 15 seconds must be selected precisely and without hesitation, and the print must be slipped (I object on principle to "snatching") from the dish. Time and temperature methods are admirable for negatives and bromide papers, but I do not consider them entirely suitable for dealing with gaslight papers. I find inspection more satisfactory, forceps more certain than fingers, and sugar most useful.—Yours, etc.,

S. W. JARVIS.

FOCAL LENGTH AND EXPOSURE.

SIR,—In your reply to "R. H.'s" question respecting the relative exposures required for lenses of the same *f*/ number but of different focal lengths, you state "... a wide-angle lens of short focus may include near foreground which is dark or has heavy shadows. This foreground may be missed altogether by the longer focus lens."

Presuming that this implies a shorter exposure is required for

A new photo-electric exposure meter, the "Rex," has recently been introduced to the English market at a price of £5. It is extremely neat and compact, measuring only $2\frac{1}{4} \times 2\frac{1}{4} \times 1\frac{1}{4}$ in., but its outstanding feature is its extraordinarily high sensitivity. Even with a subject so very dimly lighted that the exposure required at *f*/2 with the fastest pan. film is four seconds (which means 12 minutes at *f*/11 on a film of speed 23 degrees Scheiner) the meter will still give a definite and unmistakable read-

ing. In a room lit with normal artificial light the needle goes nearly half-way across the scale when the meter is pointed at a light-coloured wall. The cell is inside the base of the instrument, which is hinged at the back and flies down on pressing a button. This leaves the cell facing the subject and protected from overhead light by the body of the meter. Apart from this the cell is non-directional. If the button is kept pressed the instrument is adjusted for bright light; on releasing it the

the longer focus lens, where one and the same camera is used with two interchangeable lenses, the resulting negatives would be correctly exposed, but the prints would be different, as the lenses embrace different angles of view.

When, however, two different cameras are used, both embracing approximately the same angle of view, but using lenses of different focal length, say, for instance, a miniature with a 2-in. lens and a quarter-plate with a 6-in. lens, the reverse is the case. Theoretically, of course, there should be no difference in exposure for identical *f*/ numbers, but in practice I have found, as I believe have others, that the miniature is definitely faster. Whether it be that the emulsion is thinner or whether, as I am more inclined to think, the real reason is that the "loss of efficiency" (for want of a better phrase) is less for light travelling two inches than for light travelling six inches I cannot say. Perhaps some of your readers who have gone more deeply into this subject will enlighten us.

Another curious effect which I have found is that whilst the larger stops give identical negatives for exposures adjusted in accordance with their relative values (e.g., *f*/6.3 requires really double *f*/4.5) this does not apply when one gets down to the small stops such as *f*/32 and *f*/64, or smaller when working with an adjustable telephoto lens. When using the same camera and lens at a small aperture, if an exposure sixteen times that which is right at *f*/8 be given at *f*/64, over-exposure results. Why?—Yours, etc.,

C. P. VAUGHAN.

CONVERGING VERTICALS.

SIR,—From my knowledge of perspective gained in the days of the old Science and Art Department examinations, in which I gained a prize in third-grade perspective of planes shadows and reflections, I am confident I can unravel this now acute tangle.

The apparent assumption that all perspective drawing must be executed on a plane surface seems to be responsible for much of the misunderstanding. Two perspective surfaces are available for the artist, the spherical and the plane vertical.

Now the respective up and down vanishing points for parallel verticals must necessarily be situated directly overhead and directly underneath the observer; and if they are to be drawn converging it must be on a spherical surface. They will then appear like the circles of longitude on a globe viewed from its centre within. Each circle looked at individually would then appear as a straight line but all would converge at the north and south poles. By rotating the globe through 90 degrees the same construction would apply to parallel horizontals.

But correct perspective on a vertical flat surface is a different matter. The vertical and horizontal parallels of the view must also appear as parallels in the perspective drawing, so that when viewed from the fixed point they will appear to converge in the same proportion and to the same vanishing point as the actual objects. If shown as converging in the picture their apparent vanishing point will be nearer than that of the object. It is a matter of very simple geometry, for assuming a surface of parallel lines in the form of a rectangular cross with a construction line from each angle of the cross to the viewpoint, then where these lines intersect a vertical plane parallel to the cross, the outline they will form will be identical with that of the object, only, of course, proportionately smaller. All the lines of the picture will be similarly parallel.

Another associated fallacy is that these distorted verticals, due to the absence of a rising front, can be corrected in the enlarger. This is not the case.—Yours, etc.,

ARTHUR E. OWEN.

sensitivity is increased nearly a thousand times. An extremely simple sliding calculator allows the reading of the meter to be converted immediately into exposure time for any stop and any speed of film. The "Rex" meter is obtainable through any dealer, and the sole agents for this country are the Norse Trading Co. (London) Ltd., of 37, Rathbone Street, W.1, to whom application for any further information should be made.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

The Exhibition of Cinematography that will be held at the House of the Royal Photographic Society, 35, Russell Square, W.C.1, until November 27th (daily from 11 a.m. to 5 p.m.), will be opened by Colonel J. T. C. Moore-Brabazon, on Saturday, November 13th, at 3 p.m. Admission to the exhibition is free on signing the visitors' book.

Messrs. Pathescope Limited ask us to inform readers that their "Ace" projector cannot be adapted for motor drive. The "Imp" motor, which in one of their catalogues is listed immediately below the "Ace" projector, cannot be used with it as stated in the review in our recent Ciné and Lantern Number.

We thank the many readers who have written or phoned pointing out the misprint in last week's "A.P." Exposure Table. In the Ultra-Rapid column 7/8ths sec. should obviously be 1/8th sec.

We have recently received a copy of a newly published leaflet describing trimmers, squeegees, tripods, printing frames and other accessories bearing the well-known trade mark "Jaynay." Readers who are considering the addition to their photographic equipment of any articles of this type should write to Messrs. J. & A. Wilkinson, St. Oswald Street, Collyhurst, Manchester, 9, for a copy of this leaflet.

Will members, or intending members, of the North-West London Camera Club please note that the Hon. Secretary is now Mrs. E. F. Rutland, 110, Haverstock Hill, Hampstead, N.W.3, who will be pleased to supply particulars of the above club on request.

Messrs. Ensign Ltd., 88/89, High Holborn, have issued three Winter Lists. The first deals with indoor lighting by Photoflood lamps, Photoflash bulbs, Flash lamps and Flash powders. All models are illustrated and clearly priced. For use with cameras fitted with an antinuous release the new Model I Synchroflash outfit will prove most efficient and may be purchased for the modest sum of 27s. 6d.; an adapter for flash bulbs, complete with reflector, costing only an additional 7s. 6d. The new Geka electro-flashlamp outfit solves the inconvenience of handling flash powder by this being in capsules, which are screwed into the holder carrying a small battery. All the popular Ensign albums are also listed in this book. The second Ensign catalogue deals with Ciné Projectors, Lantern Screens and accessories, in addition to which a list is given of the various Primus Junior Lecturers' Lantern Slides available. Lastly, we have received the latest catalogue of all the well-known Ensign

Enlargers, each of which is well illustrated and described, the prices in all cases being clearly stated. Various enlarging accessories are also listed, including the new Bromide Strip Calculator priced at 5s. 6d. These books are obtainable from Messrs. Ensign at the above address.

The newly-formed Yeovil Photographic Society is making satisfactory progress during its first winter session. Good use is being made of the excellent dark-room and enlarging facilities as well as the apparatus in the ciné room. An attractive programme has been drawn up, and we would again remind amateur photographers in the district of the Hon. Secretary's name—Mr. J. G. Milner, 1, High Street, Yeovil, who will be pleased to supply them with any further information.

We have to report that a Compass camera, No. 2570, has been stolen from the car of one of our readers between October 17th and October 22nd. The camera, the property of Mr. J. L. Reynolds, Barbury, Poweys Avenue, Stoneysgate, Leicester, was in a soft blue case and had a film attachment. If any of our readers can assist in tracing the stolen article will they please communicate with Mr. Reynolds at the above address.

Under the auspices of the Ealing Public Libraries Committee the second Annual Photographic Exhibition will be held at the Hanwell Public Library Hall from the 15th to 19th November. Entries are invited from residents and those working in the Borough of Ealing. Forms and particulars may be obtained from the Librarian, Mr. M. L. Hodges, Hanwell Public Library, W.7.

The Smethwick and District Photographic Society inform us that they have now a new secretary in the place of Mr. R. T. Newman. In future all communications should be addressed to Mr. John Batten, 7, Marshall Street, Smethwick, who has taken over the office.

Readers in India will be interested to hear that the Photographic Society of India, amalgamating, among other clubs in Bombay, the Camera Art Group, has just been formed with a view to facilitating provision of a well-equipped studio, library and dark-room. Those who are interested should write to the Hon. Secretary, Mr. M. Desai, Post Box No. 5522, Bombay.

Mr. Graham Philip, 128, Westbourne Avenue, Hull, is the latest winner of the Wallace Heaton "Ships and the Sea" Competition, full particulars of which appear in our advertisement pages, with his picture entitled "The Lonely Sea and the Sky." Mr. Graham Philip has been awarded the weekly prize of one guinea.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ x 3½ x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

99. Makers' Formulæ: Developers for Kodak Papers—(2)

D. 155. Warm-Tone Developer.

Elon (Metol) ..	5 grs.	(0.6 grm.)
Sodium sulphite (anhydrous) ..	280 grs.	(32 grm.)
Hydroquinone ..	55 grs.	(6 grm.)
Kodurol (glycin) ..	35 grs.	(4 grm.)
Sodium carbonate (anhydrous) ..	250 grs.	(28 grm.)
Potassium bromide ..	55 grs.	(6 grm.)
Water to make ..	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 560 grs. (64 grm.). If crystallised carbonate is used, take 660 grs. (75 grm.).

Use 1 part of above to 2 parts water.

Gives warmest warm-black tones on Bromesko, Kovita, Kodura, and Kodopal papers. For still warmer tones, increase the exposure and dilute the developer further.

This developer is available as a Kodak Packed Chemical.

D. 156. Kodura No. 2 Developer.

Elon (Metol) ..	15 grs.	(1.7 grm.)
Sodium sulphite (anhydrous) ..	190 grs.	(22 grm.)
Hydroquinone ..	60 grs.	(6.8 grm.)
Sodium carbonate (anhydrous) ..	140 grs.	(16 grm.)
Potassium bromide ..	55 grs.	(6.3 grm.)
Water to make ..	20 oz.	(1,000 c.c.)

If crystallised sulphite or carbonate is used, take 380 grs. (44 grm.) of each.

For use, dilute with an equal quantity of water.

This developer gives normal warmth of tone on Bromesko, Kodura, Kothena and Etching Brown papers.

It is available as a Kodak Packed Chemical.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Condenser for Enlarger.

I am thinking of constructing an enlarger. Should the condenser lenses be mounted so that the convex faces touch, or should there be a space between them? Prices for condensers seem to vary widely, and none bear names like Ross or Cooke that might guarantee their quality. But does the quality of a condenser matter much?
G. H. S. (Kincardineshire.)

In the case of plano-convex condensers they are mounted so that the convex surfaces are nearly but not quite touching. As far as we are aware the big lens-makers do not make condensers, but there is considerable difference in the quality of commercial condensers, due to colour and clearness of the glass and the polishing of the surfaces. Within reasonable limits, however, the question of quality is not of very great importance in practice, particularly if you use a diffused light source or interpose a diffusing screen somewhere between light and negative.

Photography in the Cinema.

Is it possible to photograph the picture on the screen of a cinema? If so, can you suggest exposures for a reasonably bright picture?
F. T. D. (Surrey.)

Many photographs have been taken in cinemas, but we consider this a very risky proceeding, as all the pictures shown are copyright. Pictures vary so enormously in brilliance that we can suggest nothing very definite in the way of exposure, but you might try 1/10th to 1/2 sec. at your widest aperture, using an ultra-fast panchromatic film. However large your widest aperture may be, you are not likely to lose any negatives through excessive exposure.

A Week-end in Paris.

I am going to France for a week-end; will I have any trouble over my camera, which is an old one, with either French or British Customs? And may I photograph in the streets of Paris?
L. B. (Somerset.)

The French Customs will place no obstacle in the way of your taking your camera duty-free into France, and, as you say it is an old camera, you are not in the least likely to have any trouble with the English Customs on your return.

Photographs may be freely taken in the streets of Paris, provided you do not cause obstruction in doing so.

An Exposure-Meter Problem.

Can I take the exposure indicated by a photo-electric meter as always correct? If I take a portrait at 6 ft., or a landscape at infinity, the meter will show the same light value, but the portrait, according to all tables, will need the longer exposure. Does the meter only give correct exposures for distant views? H. G. (London.)

You are in error in supposing that a photo-electric meter will show the same light-value when pointed at a distant landscape or a near-by figure. There will be a difference, and that difference will be a faithful representation of the differences in the total amount of light reflected by the two subjects.

Except for subjects which show violent extremes of contrast you may follow the indications of a photo-electric meter implicitly, but, when taking a very contrasty subject you should give rather more exposure than the meter indicates.

Scheiner Degrees.

I am using an exposure meter graduated in Scheiner degrees up to 26. Using a film of speed 31° Scheiner, what allowance do I make, please?
A. J. B. (Birmingham.)

The exposure for a film of 31° Scheiner is almost exactly one-third of that required for a film of 26° Scheiner. Each step of one Scheiner degree represents an increase of speed amounting to about 26 per cent. Three such steps mount up to an increase to double speed, five steps (your case) to approximately three times, and ten steps mean an increase in speed of ten times.

"Leudi" Exposure Meter.

I have a "Leudi" exposure meter, but have lost the instructions. Could you please tell me how to use it?
A. M. S. (London.)

Your best plan will be to write to Messrs. Sands Hunter & Co., Ltd., of 37, Bedford Street, Strand, London, W.C.2, for information, as they are the importers of this meter, and will be able to supply you with the printed instructions, which will be more detailed than any we could give you.

Lens Queries.

I have a 9-cm. Tessar lens on an old 3½ × 2½ film camera, and am thinking of transferring it to a 3½ × 2½ double extension camera which I shall use mostly for copying and the like. The lens works well on a single extension camera; would it work equally well on one with double extension? And would a double extension be enough when using a telephoto supplementary lens?
G. R. (Canada.)

Your 9-cm. Tessar lens will be perfectly satisfactory when used with a double extension camera, as the covering power required at longer extension is less than at normal extension.

Whether double extension is sufficient when using a supplementary telephoto lens depends on the focal length of this, but if you use a Zeiss Proxar you will not need more than double extension.

An Interior in Colour.

A year ago I took some very successful photographs of a decorated church, by electric lighting, with exposures of 10 minutes at f/5.6. I would like to take the same subject again, using Dufaycolor. What exposure should I give?
M. M. (Southport.)

The data you give is not sufficient for us to give a confident reply to your question. You do not tell us the speed of the sensitive material used for your previous photographs, but even if you had done so the problem would not have been easy. On ordinary films photographs are successful provided the exposure neither falls below the necessary minimum nor is so long as to block up the high-lights; but colour films of all types require very much more accurately-gauged exposures. All we can do is to remind you that Dufaycolor film requires an exposure about ten to fifteen times longer than the minimum necessary to give a good negative on the fastest films made, so that if your previous exposures were on an ultra-fast film, and were just sufficiently exposed, you should try an experimental exposure on Dufaycolor of about 1½ hours. If your previous negatives were fully exposed, or were made on a slower film, the exposure for Dufaycolor will of course be correspondingly less.

Copying Glossy Prints.

In copying photographs with a glossy surface I get reflections of the light-source. Is there any way by which I could dull the surface of the prints to prevent this? L. G. E. (Essex.)

We think you had better give up the idea of making the glossy surface matt; it is not very easy to do, and when you have done it you will find the surface will have a grain that reproduces along with the picture. To copy your prints as they are you only have to arrange the lights so that their reflections from the glossy surface do not reach the lens. This is a comparatively simple matter.

FOUL MURDER !

Brutality ! Cacophony of violent death—groans and agonised cries, shrieks and blood-curdling moans. Heart-rending horror of shuddering death throes. Murder !

And we are accused ; we, so pure, so blameless, so unsullied by the baser passions, are accused by two readers of foully doing to death divers quotations from English literature ! O misere ! O misere ! Bring whips, bring scorpions, we would do penance ! Oh that this day had never dawned !

But hold ! Trumpets blow ; lusty voices cry ; bells peal ! We are reprieved—we are saved ! And simply because, spite of misquotations, countless photographers have found the way through us to a newer and happier life in the realm of miniature.

What matter, then, a murdered phrase when we give the miniaturist such service as we do ? Come ye, therefore, "Try 202 for Service !"

"202" — THE MECCA OF THE "MINIATURE" MAN

A GUARANTEE,

when issued by a firm that prides itself on its straightforward and honourable dealing, gives a feeling of security to the purchaser that it would be difficult to put into words. All miniature apparatus sold by us is guaranteed against any defect whatever for one year from date of purchase, and indefinitely after the expiration of that period against any inherent defect. So, when buying your next camera, why not "Buy 'Lewis' and Buy Safe !"

WHAT FOOLS WE WERE

last year not to cater in our usual specialising way for the man who, justly proud of his work, desired to include it in his Christmas greeting cards and calendars ! What amends we have made this year, however, for our previous lack of enterprise ! You who have seen our Camera Club catalogues know what superb design can be, and the same man has designed for us cards and calendars to take your own pictures.

Write now for particulars—Christmas is not far away, and your friends at home and abroad should not be denied a greeting from you worthy of their place in your esteem.

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS—contd. :

Super Baldina, f/2.8 Tessar, R. Compur, As new	£15 10 0
Super Ikonta 530, f/3.5 Tessar, Rapid Compur, case, As new	£14 15 0

Zeiss Ikon Nettax, f/2.8 Tessar, E.R. case, As new	£24 15 0

MINIATURE NEWS AND TIPS

THIS WEEK'S TIP.—If your negatives are lacking in contrast, or if the definition is definitely poor, a quite likely cause of the lack of good results is lens halation. Many miniaturists, we are convinced, do not appreciate this danger. The trouble is caused by a condensation of grease on the inner surfaces of the lens components from the iris and shutter, and the actual haze may be seen by holding the camera in such a way that a strong light passes obliquely through the objective. With the camera back removed the fault will be very apparent. In the interests of miniature photography we will clean any camera brought to us, free of charge ; please do not attempt the cleaning yourself unless you are confident that you are qualified for the task. A camera sent through the post should be accompanied by a remittance of 1s. 6d. to cover postage and packing.

THIS WEEK'S NEWS.—The Kalart Synchro-Flash Gun for the Leica or Contax can now be supplied. The positive synchronisation of the Kalart Gun in use with either of the two cameras mentioned permits of flash-light photography, with 100 per cent accuracy, at the hitherto unheard-of speeds of 1/500th or 1/1,000th second, even 1/1,250th sec. in the case of the Contax. The price of the gun is £4 12 6.

The ultra-fast Reflex-Korelle is now available. Model IIa, fitted f/1.9 Primoplant, costs £47 10 0. That's all for this week.

MINIATURE REFLEXES

EXAKTA WEEK

This week we are including with every second-hand Exakta sold, without extra charge, a lens hood, extension tube, focussing hood, filter and case. We should like you to verify our remarks about prices by referring to last week's "A.P." and to prices asked elsewhere for similar cameras.

A new book which will help you to get the best results with your camera!

Brighter Photography

by DAVID CHARLES, F.R.P.S.

This handy book reveals in a clear, attractive way the secrets of successful photography. Though primarily intended for the novice, it is invaluable to every keen camera user.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint. By simple cross references these illustrations provide a series of clear, concise lessons in the art of making better pictures.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26b, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

"LARGODREM"**ELECTRIC EXPOSURE METER FOR ENLARGING**

Something quite new to photography: a meter that has long been needed, and one of immense value to Amateur and Professional photographers. The "Largodrem" is simply laid on the baseboard or easel of the enlarger, the light switched on, when the correct exposure for any make of bromide paper can be instantly read on the scale.

PRICE 30/-

Including Largodrem Paper Tester.

IMPORTANT.—When ordering please state voltage of the electric supply.

Stock Exchange Branch: 1, Copthall Chambers, Throgmorton Street, London, E.C.2. (Telephone: Metropolitan 5351)

DOLLONDS
DOLLOND & AITCHISON LTD. ESTD. 1750

"I INVITE YOU ONE AND ALL

to see the latest Projectors and Enlargers and hear the latest Talkies in my demonstration theatre. My expert staff will give the best Service always, and give really sound advice on any still or Ciné problem. Our stocks are large and varied—whatever you want, from the tiniest accessory, we can supply it **at once**. Write to me personally and tell me your needs, and I will put you in the hands of experts who leave no stone unturned to see you absolutely satisfied."

Wallace Heaton

ANYTHING OVER 50/- ON OUR CONFIDENTIAL EASY PAYMENT PLAN

We give you two years to pay for goods costing £10 or more, 15 months for goods between £5 and £10, and 9 months for goods between 50/- and £5. A customer writes:

"I am very pleased indeed with the way you have handled this H.P. business with me. I have dealt with you before, but have always paid cash, and it is pleasant to find that you give equal attention to a hire purchase deal."

BELL-HOWELL "138 FILMOSOUND"

The entire machine is contained in a single case, which also accommodates a 1,600-ft. reel of film, giving 45 minutes show without a stop. In use, the combined projector and amplifier unit is removed from the case, of which the cover serves as the baffle for the self-contained loud speaker. Voltages on exciter lamp and photocell are balanced automatically as the volume control is changed. New type of tilt device, operated by one hand. Motor rewind. Cash **£138**

TALKIE AND SILENT FILM LIBRARIES

We're fully prepared to give you the best choice of films for your winter entertainments. Comedy, drama, interest, travel and cartoon pictures are included in our stock. You will be able to pick programmes exactly to your liking at moderate rates of hire. The best library in the country. The films include 9.5 and 16 mm. silent and 16-mm. sound-on-film. Lists for 2d. postage.

10 SEPARATE FREE CATALOGUES

Send 2d. postage now for any you need. The Zodel Book of New Cameras, Accessories, Ciné Apparatus, Sound-on-Film Library, 16-mm. Film Library, and 9.5-mm. Film Library, Enlargers, D. & P. Services, Minicam Accessories and Guaranteed Bargains. We are the only retail firm publishing a separate catalogue to cover each of your requirements.

EXCHANGES

Highest allowances on your used apparatus in part payment for your fresh purchase. Send your apparatus **now**, for our quotation.

VISIT OUR GALLERIES AT 127 NEW BOND ST.

You will enjoy an interesting hour any time you are in town; there's always a good show of photographs, mostly by eminent photographers. Don't forget to look us up!

SIEMENS "SIXTEEN 9"

Takes 9.5 and 16 mm. films. Has 200-watt lamp, speeds 12 to 28 pictures per sec., motor rewind. Single picture device. Silent take-up. Simple threading, self-contained resistance. Centring device and safety switch. You can't go wrong in choosing Siemens.

Cash price **£59:10:0**
24 monthly payments of **53/4**.

ZEISS MIRAPHOT

Automatic focussing. Simple in operation. A pull on the focussing lever is all that is required to focus and control size of enlargement. For any house circuit. For negatives up to 3½ x 2½ in. Complete with 1/6.3 Novar enlarging anastigmat.

Cash price **£8:2:6**
15 monthly payments of **11/5**.

ALL GOODS COSTING £10 OR MORE SUPPLIED WITH A PRINTED 3-YEAR GUARANTEE.

"KODASCOPE" MODEL EE

With handsome dual-purpose case which is not only handy for carrying purposes but also acts as a substantial vibration-proof base when the Kodascope is in action. There is also a 30-in. tilting device for accurate centring. Provided with 300-watt lamp, this model is available with a choice of six interchangeable lenses. Models supplied for either A.C. or A.C./D.C. circuits. With 1½-in. f/2 lens.

Cash price **£32:10:0**
24 monthly payments of **29/2**.

ENSIGN MAGNAPRINT

For all miniature negatives—Ensign Midget, half-V.P., Leica, Contax and similar sizes, fitted with 60-mm. Dallmeyer f/4.5 anastigmat and 2½-in. condenser. Enlarges Ensign Midget and half-V.P. to all sizes from 2½ x 3½ in. to 15 x 12 in., other sizes in proportion.

Cash price **£9:10:0**
15 monthly payments of **13/4**.

THE FIRST MONTHLY INSTALMENT GETS YOUR PURCHASE—NO DEPOSIT TO PAY.

FILMO "EIGHT" PROJECTOR

400-watt illumination—through perfected optical system employing fast f/1.6 lens, gives clear, brilliant 8-mm. pictures on 6-ft. screen. Made for use with Filmo "8" Cameras, fully gear driven.

Cash price **£41:0:0**
24 monthly payments of **36/9**.

M & W FAM ENLARGER

Fam 111 for roll films and plates up to 6 x 6 cm. Double anastigmat f/4.5 9-cm. lens, with iris stop, exchangeable against additional lens 5.5-cm. focal length, with manual focussing. Condenser with 100-watt opal lamp. Dual control, rise and fall and fine focussing.

Cash price **£18:18:0**
24 monthly payments of **17/-**.

PICTURE MAKING AT HOME...

*After
dark*

The evenings are drawing in—but that's no reason for putting away your camera. In fact, it's just the time for you to start upon one of the most fascinating branches of camera work—night photography. And what better place to begin than in your own house? Portraits of your family and friends, pictorial records of happy fireside incidents—these will fill many a page of your album. Difficult? Not a bit of it. It's as easy as taking daylight snapshots—provided you use Selo Hypersensitive Panchromatic Roll Film or Ilford Hypersensitive Panchromatic Plates.

KODAK

NEWS

The Other Half of the Story

So far as materials go, the right Film and the right Paper are only half the photographic story. The right Chemicals are as important.

The ease and rapidity with which you can carry out your darkroom operations, the quality of your negatives, and the permanence of your prints, are all affected by the kind of Chemicals you use.

Specify "Kodak Tested" and you're safe. The accurately compounded Kodak Developers, Fixers, Toners, etc., available from your Kodak Dealer are as pure and uniform and photographically efficient as highly qualified chemists and the resources of the magnificent new Kodak research laboratories can make them.

KODAK LIMITED
KODAK HOUSE, KINGSWAY, LONDON, W.C.2

STAY AT HOME TO-NIGHT AND ENJOY YOURSELF —TAKING PICTURES “FIGURE STUDIES & PORTRAITS” for Wallace Heaton's PHOTOGRAPHIC COMPETITION

A little ingenious arrangement of backgrounds, a couple of Photofloods, and members of the family to pose for you, and it's possible for an amateur to get some really good pictures. Dramatic lighting effects can play a big part in getting your pictures 'over.' Of course, this competition is not tied down to indoor shots—if you have any good photographs—wherever they were taken—send them along to us. There's no entrance fee, but you must be an amateur. We leave the choice of camera and materials entirely to you.

RULES AND CONDITIONS

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA or MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended). WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks). If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry. A selection of the best entries will be held back at the close of the competition for exhibiting in our galleries prior to their return.

Last Week's Prize-winner :

F. J. TAYLOR, 11, First Avenue, Blyth, Northumberland, with picture "In the Breeze" ("Ships and the Sea" Comp.).

£25 FIRST PRIZE AND A 21/- WEEKLY PRIZE AND SIX CERTIFICATES OF MERIT WEEKLY

ADDRESS YOUR ENTRIES TO "FIGURE STUDIES AND PORTRAITS" COMPETITION,

WALLACE HEATON LTD.

127, NEW BOND STREET, LONDON, W.1

WALLACE HEATON COMPETITION

COUPON to be affixed to back of print. Valid until Competition closes on December 31st, 1937.

EVERY SUBJECT is easier with a

THREE MODELS. (Interchangeable lenses).

With Zeiss Tessar f/2.8—3 cm. £29 10 0	Interchangeable Telephoto Lens Schneider Tele- Xenar f/5.5—5' cm. £10 0 0
With Zeiss Tessar f/3.5—3cm. £28 10 0	
With Meyer Primo- tar f/3.5—3 cm. £23 10 0	

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position—no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and supersedes range-finders.
- Takes up to 50 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan." to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 to 1/500th sec.—and all intermediate speeds.
- Weighs 14 oz.—just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½ x 2½ x 2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight-loading spools available.
- Camera has stainless steel body, covered black morocco.

Including splicing outfit, reel, brush, etc., universal motor drive, f/2.5 lens, finely ground and polished, capacity 400 ft., die-cast construction. Hi-gear motor winding, knob swivel device for tilting.

Cash price **£27 : 10 : 0**

24 monthly payments of 24/8.

SIEMENS

"SIXTEEN-9"

Takes 9.5 and 16 mm. films. Has 200-watt lamp, speeds 12 to 28 pictures per sec., motor rewind. Single threading device. Silent take-up. Simple threading. Self-contained resistance. Centring device and safety switch. You can't go wrong in choosing Siemens.

Cash price **£59 : 10 : 0**

24 monthly payments of 53/4.

9.5-mm. CORONET

Sprocket drive. Brilliant flickerless pictures. Silent running. Geared rewinds 5-1 ratio, rewinding in a flash. Combined lamp and wall plug. Takes 30, 60 or 400 ft. reels without adjustment. 1-in. anastigmat projection lens. Any voltage 100-250 A.C. or D.C. With motor drive and super attachment.

Cash price **£9 : 17 : 6**

15 monthly payments of 13/7.

"KODASCOPE" 50.R 8-mm.

The extra-powerful 200-watt lamp gives brilliant picture measuring 30 x 22 in. 14 1/2 ft. from the screen, or 40 x 30 in. at 19 ft. Can be used on any circuit by means of small interchangeable plug-in resistances. Fast motor-driven rewind, large cooling fan and sturdy construction, are among its features.

Price, including 1-in. lens and accessories **£13:13:0**
24 monthly payments of 12/8.

'KODASCOPE' EE

With handsome dual-purpose case, which also acts as a substantial vibration-proof base when the Kodascope is in action. There is also a 30-in. tilting device for accurate centring. Provided with 300-watt lamp, this model is available with a choice of six interchangeable lenses. Models supplied for either A.C. or A.C./D.C. circuits. With 1 1/2-in. lens.

Cash price **£32 : 10 : 0**

24 monthly payments of 29/2.

ENSIGN MAGNAPRINT

Standard model for miniature negatives. Gives critical focussing by means of helicoidal lens mount which locks firmly into correct position. For half-V.P. Leica, Contax, and similar sizes. With Ensign f/6.3 enlarging anastigmat.

Cash price **£5 : 5 : 0**

15 monthly payments of 7/4.

A PERSONAL MESSAGE FROM OUR MANAGING DIRECTOR

"We are now at the height of the indoor entertainment season, and it is the wish of my managers and myself that you should be able to easily acquire any apparatus you need. Our answer to the problem is to put the best range at your disposal on terms to suit your pocket. Whether you are interested in movies, talkies, enlarging or indoor photography, I can assure you of first-rate service at any 'City Sale' shop."

Wallace Heaton

£13:10:0

12 monthly payments of 23/8, 24 of 11/10.

● NEW & BETTER Lower Priced The "WESTEX CRYSTAL" Ciné Screen

This new screen, now available and obtainable only at The WESTMINSTER, represents greater value than anything previously offered. The price is very much lower than similar products; the workmanship and efficiency are of the very highest standards.

Each screen is fitted with rollers and side stretchers to ensure an absolutely flat surface. Two advantages offered by these special side stretchers, apart from their obvious functions, are as follows:—

1 A black surround is formed by the roller and platten at top and bottom and the black side stretchers, which have been so placed as to complete the surrounding margin and present a screen neatly and efficiently masked in black.

2 The butterfly nuts holding the stretchers need NOT be removed before erecting or dismantling.

The new CRYSTAL surface is virtually NON-DIRECTIONAL and the beads will not "flake" or "chip," in fact the surface is scratch-proof.

Hooks are provided to hang the screen, and it is sold in a strong cardboard box for storage.

We stock all makes of screens and shall be pleased to demonstrate the new "Westex Crystal" Screen in comparison with any other of similar type—irrespective of price.

PRICES OF "WESTEX CRYSTAL" SCREENS.

36×27 in. 27/6 Plus 6d.
48×36 in. 32/6 Plus 9d.
60×45 in. 50/- Plus 1/- part postage.

Complete with stretchers and in cardboard box.

VERSATILITY!

Rolleicord

TO-DAY'S BEST VALUE IN TWIN-LENS REFLEXES !

Simple to use because it shows your pictures full size and right way up on the ground-glass screen and a simple turn of a milled knob is all that is required to get the picture in dead-sharp focus. Economical because it gives twelve perfect pictures on $3\frac{1}{2} \times 2\frac{1}{4}$ roll film for 1/-, pictures large enough to appreciate without the necessary cost of enlarging. Versatile because it can be adapted for plates or 35-mm. miniature film, and takes all Rolleiflex accessories except only the angle mirror. Both models are fitted with Compur shutter speeded to 1/300th sec., T. and B. The Model IA has f/4.5 Zeiss Triotar lens, and is amazing value at only.....£12 10 0

The Model II has f/3.5 Zeiss Triotar lens, and costs only.....£16 10 0

50 PAGES OF
FACTS AND
FORMULÆ

The AMATEUR PHOTOGRAPHER DIARY

AND HANDBOOK FOR 1938

This useful little handbook contains, in addition to the usual diary pages—one week to the page—over fifty pages of facts and formulæ for the keen camera user. Information is given on developing, fixing baths, mountants, and finishing negatives and prints. Numerous reference tables dealing with hyperfocal distances, enlarging, screen distances for lantern projection and exposures are included, as well as sections for exposure records and personal memoranda.

Size $3\frac{1}{2} \times 5\frac{1}{2}$ inches, well printed, neatly and strongly bound in leather cloth, with back loop pencil and round corners.

PILOT "6"

ROLL FILM REFLEX

Although amazingly inexpensive, the Pilot "6" is a real reflex camera in every sense of the word, and gives you the same working efficiency as much more costly apparatus. It takes 12 exposures 2½ in. square. Shutter speeds 1/25th, 1/50th and 1/100th sec., also B. and T. Focussing on ground-glass screen with deep hood, a magnifier for fine focussing is provided. Full-size wire frame direct-vision finder for using camera at eye-level. Shoulder strap and wire release. Dimensions 3 x 3½ x 4 in. Weight about 22 oz.

PRICES:

No.	£ s. d.	No.	£ s. d.

Obtainable from any Photographic Dealer.

SANDS HUNTER & CO. LTD.
37, BEDFORD ST., STRAND, W.C.2

Do you know what this is?

The illustration shows the shutter winding wheel on the Contax II. The winding up of the shutter also automatically advances the film for the next exposure, thus making for speedy manipulation while eliminating unintentional double exposures; although of course, double exposures can very easily be made if desired for special effects. The shutter release is conveniently situated in the centre of the shutter winding wheel, the whole scale of speeds from $\frac{1}{2}$ to $1/1,250$ th second is always completely visible on one dial and the exposure time can be adjusted either before or after winding the shutter.

The built-in exposure number indicator is shown on the left of the winding wheel, while further to the left above it can be seen the controlling wheel of the long base patent wedge distance meter of the Contax II, which is combined in one eyepiece with the view-finder and automatically coupled with the interchangeable Zeiss lenses. It can thus be seen that all the controls of the Contax II are on top of the camera—with the single exception of that for the built-in delayed-action release which is on the front—which greatly adds to the speed and convenience of manipulation.

Vol. LXXXIV. No. 2558.

EACH year the Annual Dinner of the Royal Photographic Society becomes a more attractive function, and one with a greater significance in the photographic world. Not only is it attended by members who represent all classes of photographers—amateur, professional, manufacturer and dealer, but representatives of other bodies are also pleased to be present. This year the dinner was again held in the large dining hall of the Monico, Piccadilly Circus, and the numbers present exceeded any previous gathering of the sort. The President of the Society, Dr. D. A. Spencer, was in the chair, and the toast of the Royal Photographic Society was proposed by the Rt. Hon. Lord Strabolgi, who had many things to say regarding the future of photography and cinematography. One of the outstanding points of discussion during the evening, and one that was referred to in most of the speeches, was the future home of the Society. This has now been settled, and 16, Prince's Gate, Kensington, will shortly be the new address of the Royal Photographic Society. The toast of "Our New Home" was proposed by Mr. E. A. Robins, and it is probably the first time that a toast has been illustrated by lantern slides, as Mr. Robins showed a number of views of the interior and exterior of this fine house, which includes forty-three rooms, and a ballroom capable of housing the Annual Exhibition. Mr. T. Midgley Illingworth responded to this toast, and the guests were proposed by Dr. Olaf Bloch, in his own inimitable manner. Sir Thomas W. McAra replied to this. Dr. Spencer made a brilliant speech in which he referred not only to the various activities of the Society, but outlined some of the

TOPICS of the Week

IN TRAFALGAR SQUARE.

Even on wet autumn days this familiar subject is still worth an exposure. The reflections add to its pictorial possibilities.

plans for the future, and again made his appeal to all concerned for funds to complete the purchase and equip the new premises. Readers of "The A.P." please note.

Fifty Years Ago.

In the brochure which W. Watson and Sons have got out to celebrate the centenary of the founding of their firm, there are some interesting references to the photography of fifty years ago. That was a time when "crowned heads and members of the nobility flitted through the showrooms, anxious to secure one of the latest Acme cameras—there was a long waiting list—or to receive advice or criticism on their photographic efforts." It is stated that there are in the archives of the firm prints from negatives taken by members of the Royal Family. The Acme camera came out in 1889. It was made to take plates $6\frac{1}{2} \times 4\frac{3}{4}$ in., which would be counted large to-day, but it was sold to amateurs as well as professionals, and was carried on tours and holiday rambles strapped to the back of the stalwarts. It was about 1890 that the first form of reflex camera was introduced—the Vanneck hand camera—which had a great vogue amongst the early hand cameras. It was compact in size, had no delicate mechanical parts, and the facility of seeing the subject up to the moment of exposure enabled very accurate work to be done. Four years earlier Watson's had put a detective camera on the market, one of the earliest of the hand cameras. It had a focussing device by means of a lever on the under-side and an adjustable exposure shutter.

"This 'Ere Progress."

"This 'ere progress," as one of Mr. Wells's characters says, "it

keeps on keeping on." "Progress," first with a note of interrogation after it, and then with a note of exclamation, was the title of Mr. Pollard Crowther's address at the opening meeting of the session of the Pictorial Group, and so vague a title gave him the opportunity of ranging over everything. One listens with fascinated interest to Mr. Crowther's ruminations on men and affairs, and even if one has a sense of having heard it all before it does not diminish one's pleasure. He bowed his head sorrowfully and admitted that he knew he was a good talker. He asked those present how many of them had heard him tell the story of a photograph of Rabindranath Tagore, and everybody held up his hand—some held up both hands to indicate they had heard it twice—and, thus encouraged, Mr. Crowther proceeded to tell it again, and the audience enjoyed it as much as ever. In regard to progress Mr. Crowther has some way to go. He began with a whole-plate camera, went on to a half-plate, and now has a 5×4, with which he has made at least 30,000 exposures. He formerly used 10,000 candle-power at a time, and now uses 250 or something like that.

When he has got down to postage-stamp size, and to photographing by the light of a match we shall expect to hear him tell the story of Rabindranath Tagore again, and he will be forgiven.

Photographic Aphorisms.

The worst thing about proverbs and aphorisms and wisecracks is that they appear on the face of them to be so true and convincing, and then one feels after a little reflection that there are exceptions to their truth, and presently that they are wholly untrue. So one felt with regard to the aphorisms of which Mr. Pollard Crowther delivered himself during his recent address to the Pictorial Group (some of them he acknowledged to be not his own). But here they are for what they are worth—or some of them: "The one faculty necessary for any person working with the camera is to be able to tell good work from bad, especially his own." That, be it noticed, leaves it in doubt as to the category in which his own work is to be ranked. Then again: "However much technique a photographer has, nothing can make up for lack of individuality, originality

and vision." And here is a first-class definition: "Doing easily what other people find difficult is talent." There again one might turn it round and say that the good worker does with difficulty what other people find easy. And one more: "The artist is one who is free to express real things without constant technical preoccupation." And yet another: "The skilled photographer is one who uses rules of composition instinctively and breaks them successfully." And the more he breaks them the more skilled he is.

Hotel Dark-rooms.

Everyone has wondered at the celerity with which a photograph is taken at a public dinner just before the soup, and by the time the sweet is reached a mounted copy is being circulated and asking for the sympathetic consideration of the audience. At a well-known London restaurant the other night we asked the photographer how it was done, and we were told that this enterprising establishment at all events—and he said that there were others—provided a dark-room and other facilities for photographic work on the premises.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Lantern Cover-Glasses.

What are the best glasses to use for binding up lantern slides? I have a quantity of waste quarter-plate negatives; can these be used?

S. S. I. (Dublin.)

It is important to consider the quality of lantern-slide cover-glasses. They must be as free from flaws as the slides themselves, and they must be of suitable thickness. They are obtainable commercially at varying prices according to quality, and it pays to buy only the best.

If the glasses are too thick they add unnecessarily to the bulk and weight of a set and there is also the awkward possibility of their being too thick to drop into the lantern carrier. Your negatives are almost certain to be satisfactory from the point of view of freedom from flaws; but if they are very old you may find that they are too thick. It is easy to decide the point. Pile them up to a height of one inch, and count them; they should run from eighteen to twenty to the inch. Old negatives may only count about twelve to the inch, and are therefore too thick.

To clean off the emulsion the negatives should be soaked in water for an hour or two, laid out a few at a time on the bottom of a dish, and boiling water poured over them. The gelatine usually softens at once, except in the case of very old negatives and those that have been hardened, when the film can often be stripped off. In any case a nail-brush is a good tool for scrubbing the glass clean. A rinse under the tap completes the job.

The next step is to cut an inch off the long way of the glass with a diamond or a wheel cutter. We have described and

illustrated various simple gadgets for facilitating this task, but it can easily be done as follows:—

Lay one glass vertically, and on the left side of it lay another glass horizontal way, touching each other, and with the bottom edges exactly in line. Place a ruler across the two so that the cutter follows the top edge of the horizontal glass, and then runs straight across the vertical glass. This removes a strip one inch wide, and so leaves the cover-glass 3¼-in. square. Firm pressure must be maintained on the ruler and the two glasses while the cut is made.

Infra-Red Photography.

Can I get infra-red negatives on ordinary or panchromatic film if I put the appropriate filter on the lens? T. M. (Highbury.)

You cannot do so. There is a great deal more in infra-red work than the mere use of a filter. The correct filter would pass practically no rays that would affect ordinary sensitive material. Special sensitive material is used for the purpose, and it is quite likely that such plates or films may be fogged by invisible infra-red light penetrating the camera, bellows or dark slides.

No one should attempt this special kind of work without first acquainting himself thoroughly with the conditions under which it is carried out. The best way of acquiring this knowledge is from a textbook such as "Infra-Red Photography," by Dr. S. O. Rawling, published by Messrs. Blackie & Sons at 3s. 6d. This will give you a knowledge of the theory and practice of the subject, including the materials available and the source of supply, and the precautions to take in regard to apparatus.

Colouring Enlargements by Hand

By
K. G. BILBE.

Hand-coloured and tinted photographs have earned themselves a bad name in many quarters for no other reason than that the work has so often been badly and inartistically done. Applied with real skill and knowledge a coloured photograph can be most attractive, and this article offers a number of valuable suggestions.

THE art of adding colour to a print is often tabooed as being non-photographic and therefore outside the sphere of enthusiasts, but such sophisticated allegation seems to imply that a photographer is not an artist. Hand-tinted photographs seem in fact to be the Cinderellas of the art world. The technique is considered too easy for the expert and too simple for the amateur, but if the work is carried out by an enthusiast, the results can be most pleasing and distinctive.

Oil or Water Colours?

Various outfits for introducing colour to prints are now on the market. Water-colour stains have proved highly successful over a number of years, and oils are also favoured. I have worked with several different materials and have lately become a staunch adherent to the new oil crayons, which are used in conjunction with a solvent medium. Comparisons cannot be drawn between any particular methods because each has its own characteristics. Water-colour retains a delightful translucent effect which may not be imitated by oils, but a greater density of colour can more easily be rendered by the latter.

Light and Lighting.

An important rule to remember is never to work by artificial light. The result may seem very attractive when viewed close to a lamp, but the shades will always be faulty when seen in daylight, or in a comparatively ill-lit part of a room, such as the wall on which the picture will probably hang. Broad sunlight should be avoided at all costs, and the best position to choose is behind drawn curtains, fairly close to a window.

Much depends on good monochrome gradations in the base print, and for this reason the recent panchromatic emulsions have caused quite a filip in hand colouring. A great range of tones should always be aimed at when a photograph is being produced for colouring purposes. Filters help considerably, and even a reddish contrast-screen is of great value, especially in producing faithful sky tones. But for most purposes a pale green or yellow filter is the best to use, coupled with a little hand control when the negative

is in the enlarger. A print that is composed of large, contrasty areas is useless for this type of work, but black-and-white is the best base because it is less likely to interfere with the colours.

The Right Kind of Print.

In view of the foregoing a soft-working paper seems to be indicated, the print being made from a negative that embodies a full range of light and shade. The surface should not be glazed in any way, but "art," matt and other fancy finishes seem to accept the pigment perfectly well.

It will be found that greens should be varied in accordance with the type of vegetation, the time of the year, and the prevailing lighting conditions. Hedges and fields are of darker hue than grass in landscape work, and fields change in colour with their various crops. The basic photographic tones help the amateur to a certain extent, but they also tend to encourage laziness on his part in regard to the choice of pigments. However, it pays to exercise patient observation and to take pains to get realistic effects. Aqueous reflections require considerable thought and experiment, for water is never blue when it lies beneath a green bank. Shadows are often improved by a slight suggestion of opposite colour to that which casts them. One frequently sees an effect of red in the shadows of green, and a portrait is enhanced beyond expectation if the tiniest trace of blue is spread in the eye-shadows and among those of the face and neck.

Reflections.

The high-lights of a reflection can seldom be treated with anything but a pale suggestion of yellow or blue, but mostly they should be left entirely alone. The sparkle of sunlight on water must be worked upon with utmost caution, and the same applies to high spots such as the sheen on a vehicle or the polish in plating.

Care should be taken in maintaining clear outlines wherever possible. A good sky effect is often spoiled by prominent blotches of colour which have been allowed to run off the blue on to the clouds, but frequently cloud-formations have delicate colour-

ings of their own. The merest trace of pink or a faint blur of yellow or brown can sometimes improve them, especially when they appear on the horizon. A sky is never blue to its extreme horizon, no matter how clear it seems, and therefore a suggestion of yellow or pale green should always separate it from the outlines of the landscape. Distant hills should not be touched with green but rather with a mixture of blue and red, forming a pale violet haziness which is absolutely true to life.

Artistic Licence.

Rocks, walls, and other stony subjects should be allowed a little artistic licence. A few wisps of green and a spot of reddish pigment can extract all monotony from a flat wash of brown or grey colour. Most walls have scraps of moss and lichen growing in their crevices, and these should be used in fashioning a really life-like picture.

Any number of shades are readily produced by mixing the essential colouring materials. Blue and yellow can be used for any blend of green, whilst all sorts of greys, mauves, violets and purples are easily formed with blue and red. Flesh tints are variable according to the many types of complexion, and these can be made by yellow and red. A girl's skin invariably needs more delicate colouring than that of a man, and this point should be remembered if two people appear in the same photograph.

Not Too Much Detail.

One item should always be borne in mind when finishing a print, and that is to avoid a mass of detail colouring. In tinting the windows of a house, unless it is a close-up, such features as curtains are best left untouched. A trace of blue on each pane of glass transforms a photographic reflection into something vivid and live, but multi-coloured draperies will kill the effect. Small heads of figures should not be treated as portraits, otherwise the facial characteristics will be lost by a glint of colour in the wrong place. It is therefore more prudent to smear on a thin wash of flesh tint with very little shadow-relief.

November 17th, 1937

The Photo

By W. E. BALL.

For the earnest photographer, as distinct from the casual "button pusher," there are many opportunities for exercising his powers of observation and for cultivating the "seeing eye" for effects, be it either in the grouping of many trees, or the single tree standing in lonely splendour.

Trees can in themselves form the

Winter's Flood-lighting (Walton-on-Thames flood). January, 3 p.m., 1/15th sec., f/4.5, S.G. Pan. plate.

THE photography of trees can be an all-the-year-round pursuit. In either summer or winter it will prove to be a glorious hunting-ground. And what a limitless field for choice is available to the keen photographer who sets out to make trees a subject for his pictures. Most parks, commons, heaths and open spaces abound in subjects that are just waiting for the photographer. In fact, it might almost be said there are more opportunities here than in other subjects, principally on account of the abundance of material thrust before one by Nature herself.

Perhaps it should be said here that this branch of photography is a little removed from that which has a "human interest" for its chief motive. "Human interest" subjects are very much in the foreground nowadays, and it can safely be said that the majority of the prize-winning pictures in the daily papers and magazines are of this nature.

These remarks are interposed here because there may be a tendency on the part of some to lose sight of the beauties inherent in those subjects which do not exhibit, in themselves, the human interest motive.

Trees chief subject (Callander, Scotland). 8 a.m., June, 1/25th sec., f/8, Agfa Iso.

The Slender Silver Birch (Loch Arne). June, 1/50th sec., f/16, Agfa Iso.

chief motive of a picture. There will of necessity be other matter in the view, but it will not infrequently be found that the greater proportion of the interest of the picture is claimed by the trees themselves.

The effect of sun shining on the beautiful bark of the slender silver birch is a joy to behold, and should make an instant appeal to the photographer who has a sense of beauty.

The delicate tracery of branches and leaves will often enhance the effect of a landscape and can at times form a very agreeable "frame" to a picture.

Of all trees perhaps the stately elm presents the most decorative pattern, and a photograph taken when the branches are not fully clothed with leaves will reveal the beautiful outlines which its summer clothing would conceal from view.

Some lovely effects can be secured by taking pictures of trees against the light, when the leaves will be edged with sunshine. In such cases it is no difficult matter to see that the sun's rays are not shining on the lens, as the branches can form a sun screen if the position is carefully chosen.

graphy of TREES

THE IDEAL OUTDOOR SUBJECT
IN WINTER OR SUMMER.

There is no need to confine one's photography to trees only when in leaf, as many a fine study can be taken in the winter when they are leafless. A well-selected group of trees, or even one tree by the water's edge, will always make a strong appeal to the pictorial artist—for as such should the photographer consider himself. At other times

Silhouette of trees forming frame (Derwentwater). June, 1/50th sec., f/8, Agfa Iso.

required in the sky a pale yellow filter will do all that is necessary.

The only other case in which a filter need be employed is when it is desired to cut out haze, but a picture of this nature can easily be spoiled by a too meticulous clearness, where a little haze in the distance would make all the difference between a picture and a mere photograph.

Effect of tree foreground (Battersea Power Station at back). January, 1/25th sec., f/11, S.G. Pan. plate.

a fine sky behind a well-chosen tree pattern will often emphasise the beauty of its design.

Unquestionably the best type of plate or film to use is the panchromatic, especially for rendering the late autumn tints. As regards the use of a colour filter, there is no need to employ one unless it is required to emphasise the contrast in a blue-and-white sky background. A grey sky needs no filter at all. Panchromatic films alone (without a filter) will nowadays give almost all that is needed, but if more contrast should be

The Stately Elm, showing beautiful design of branches before being obscured by summer leaves. March, 1/25th sec., f/8, S.G. Pan. plate.

Readers' Hints, Tips and Gadgets

A TIMER FOR PRINTING.

THIS accessory, though easily made, so facilitates exact timing in gaslight printing as to be almost indispensable. Procure a long nail, say about five or six inches long, and drive it about an inch into the wall in a place which is in easy sight from the printing position, and suspend from it some bright heavy object, such as a half-inch brass nut, by a loop of thread of which one end must be close to the wall and the other end close to the head of the nail, so that the centre of the weight is a full $9\frac{1}{4}$ in. below the line from which it swings. When swinging it will be found that the weight will take one second, near enough for all practical purposes, from one end of its swing to the other and back again, and that this time does not vary as the swing gets shorter.

If it is not desirable to drive a nail

into the wall, or to leave the pendulum permanently in position, there may be a shelf conveniently placed. From this the weight can be suspended by a single thread held by a letter-clip, but it will be found to alter its direction of swing, and if too close to the wall will strike it and pull up.

It is not, of course, necessary that the swings should be seconds, but it is a convenient time to use, and tends to greater accuracy when it is desired to count seconds on other occasions.

The ease and exactness of timing and the advantage of having hands and, practically, eyes free by using this simple accessory must be tried to be believed.

In making enlargements it will be found equally valuable, and where shading has to be done it is practically indispensable.

A. F. BEACH.

A REMOTE CONTROL SHUTTER-RELEASE.

IT sometimes happens that an amateur photographer wishes to include himself in one of his subjects. A commercial delayed-action device for

The tripod is set up with one of its legs resting on either end of the lath. This serves to hold the trap still when it is released. A length of thread is attached to the hook supposed to hold the cheese. Another is attached to the lid of the trap by means of a small nail near the lower edge, and the trap is set. The other end of this second thread is attached to the shutter release of the camera, so that the thread is almost taut.

A pull on the "cheese-thread" releases the trap and the trap releases the shutter.

For time exposures the procedure is a little more complicated. A lens-cap is placed over the lens, and the shutter is opened. Since the shutter is set at time, a second pressure will close it again. The trap is used to give the second pressure.

Thus the exposure is commenced by pulling off the lens-cap by means of a piece of thread, and concluded by releasing the trap as before. The slightest touch on the "cheese-thread" will suffice for this, so no visible movement of the subject need be feared.

R. C. CLEMENTS.

COLOUR TRANSPARENCIES IN THE ALBUM.

A NOTICEABLE disadvantage of colour transparencies, as received from the processing firms, is the fact that it is impossible to store them in an album, and so view them in the same manner as ordinary contact prints or enlargements. This may be overcome as follows:

First, cut a piece of white notepaper so that a margin of about $\frac{1}{4}$ in. protrudes all round the mounted transparency, when the latter is laid upon it. Stick the notepaper with gum or other mountant, to the centre of the album page.

Next, fit the transparency by means of

a narrow strip of adhesive tape to the bottom edge of the notepaper, in such a manner that it hinges about its lower edge.

To view, turn the paper towards a strong source of light, e.g., a lighted window, and raise the transparency until the best viewing position is found, as in the diagram.

The transparency may be laid flat on top of the notepaper and the album closed in the usual way. A complete album of transparencies can be built up, alternating them with sheets of white paper.

D. M. HUGHES.

this purpose costs from five shillings upwards, and not all cameras have this feature incorporated.

The device described here costs two-pence, and works perfectly satisfactorily.

A mouse-trap of the cage type is purchased. This is nailed to the middle of a strip of lath—the one I use is about a yard in length, though this is not important. This, with a tripod and some thread, is all that is required.

I HAVE RAISED UP
A MONUMENT
MORE LASTING
THAN BRONZE.

HORACE

Leica

In 1925, when the Leica camera was first introduced, the foundation stone was laid of a monument of influence that will last as long as photography. From the first the Leica broke completely with tradition. It started a new era of photography—it set up new high standards for amateurs. And as the Leica's enormous potentialities became apparent there took place an unmistakable change in the trend of camera design generally. To-day a quarter of a million happy photographers enjoy the superiority of Leica photography. Learn more of the Leica from your dealer or descriptive literature will be sent on request.

E. LEITZ (LONDON) 20, MORTIMER STREET, LONDON, W.1

"Leica News and Technique," a bi monthly illustrated journal, is distributed free of charge to all Leica users in Britain who register their camera number with us. A specimen copy is gladly sent free of charge to anybody interested.

FLIES' EYEBROWS IN ASPIC

constitutes, we understand, a dish of surpassing delicacy. Unfortunately, we cannot claim ever to have indulged ourselves by sampling the dish, but a sudden thought jammed itself in our cerebral works last night, just as we were raising our last year's brimless bowler to that Mrs. Gigglethorpe of No. 17.

Just think (we thought) how many people there must be who, like us, have never tried F. E. in A., and yet who would welcome the opportunity to do so!

And just think (we thought) how often the same situation must apply in the cases of photographers who have never used a miniature, and yet would welcome the chance to own one!

Yet just think (we thought) how easily those fellow amateurs could become fellow miniaturists if they would avail themselves of our hire purchase arrangements—if only they would realise that nowadays one doesn't become *déclassé* by extending payment over a period.

Finally, just think (we thought, as we replaced our hat) how happy they would be if they would only "Try 202 for Service!"

MINIATURE NEWS AND TIPS

THIS WEEK'S TIP.—When a really fine fine-grain negative is aimed at, it is rather difficult to decide upon the combination of developer and film to use, and also the amount of exposure, etc., to give. We have found that it is extremely difficult to get better results than those obtained by developing Agfa F or Perutz Perpanic in Sease 1. In the former case (with the new stock, of course) we give a double increase in exposure, and in the latter case four times. In order to retain the high-lights in the negative, we find it best to restrict fixing times to 8 minutes for the Agfa F and to 10 minutes for the Perpanic. 20× enlargements are child's play when this combination is used.

THIS WEEK'S NEWS.—We were recently deluged with enquiries from miniaturists who had read in L. N. & T. of the new product "Eugradol." Our news this week is that we can supply this solution from stock at 5/- per bottle. This product can be used with absolute certainty as an after-treatment on any negative that, for some reason or another, has turned out too hard. The high-lights are reduced without any loss of shadow detail, and without the fine grain being affected in any way.

A GUARANTEE,

when issued by a firm that prides itself on its straightforward and honourable dealing, gives a feeling of security to the purchaser that it would be difficult to put into words. All miniature apparatus sold by us is guaranteed against any defect whatever for one year from date of purchase, and indefinitely after the expiration of that period against any inherent defect. So, when buying your next camera, why not "Buy 'Lewis' and Buy Safe!"

SPECIAL WIDE-APERTURE LEICAS FOR WINTER PHOTOGRAPHY

Leica IIIa, f/1.5 Xenon. As new..	£47 10 0
Leica IIIa, fitted latest f/1.9 Hektor. As new	£41 15 0
Leica IIIa, f/2 Summar, E.R. case. As new	£35 10 0
Leica III, chromium, f/2 Summar, E.R. case. As new	£32 10 0
Leica III, black, f/2 Summar, E.R. case. As new	£31 10 0

LEICAS:

Leica II, chromium, f/3.5 Elmar. Indistinguishable from new	£22 15 0
Leica II, black, f/3.5 Elmar, E.R. case. Practically as new	£19 10 0
73-cm. f/1.9 Hektor Lens, latest rectilinear focussing. As new	£19 17 6
Another, as above, but non-rectilinear. Excellent condition	£17 17 6
2.8-cm. f/6.3 Hektor, nickel. As new	£8 0 0
4-cm. f/1.5 Meyer-Plasmat, for Leica. As new	£10 17 6
Leica Stereo Viewing Apparatus. As new	£5 5 0
Leica Stereo Taking Apparatus. As new	£5 5 0
Universal Finder (black), Vidom	£3 5 0
10.5-cm. f/6.3 Leitz Elmar, coupled. Excellent condition	£6 19 6
9-cm. Elmar f/4, uncoupled. Good condition	£5 17 6
13.5-cm. f/4.5 Elmar, coupled. Excellent condition	£10 17 6
As above, but uncoupled	£6 18 6

TO LEICA USERS ONLY.

Don't wish you had the new f/1.5 Xenon—have it! We will make you an exceptional allowance on your present Summar in part exchange against one of these lenses, and we, having used the Xenon, can assure you that you will not regret the change. At f/2 we can definitely say that the Xenon is as good as the Summar at full aperture. The price of the f/1.5 5-cm. Schneider Xenon (specially designed by Taylor-Hobson) is £34.

CONTAXES:

Contax II, f/2 Sonnar, E.R. case. As new..	£39 10 0
Contax I, slow-speeds model, fitted new-type collapsible f/2 Sonnar. As new	£29 15 0
8.5-cm. f/4 Triotar for the Contax, any model. As new	£11 15 0

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS:

Kodak Regent, f/4.5 Tessar, case. As new..	£13 18 6

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

At the P.D.A. Dinner with a Miniature

By
P. R. PARKER.

WHEN I arrived at the Park Lane Hotel for the Photographic Dealers' Association dinner I was rather nervous of the reception I would receive with my camera and flashgun apparatus. So, putting the Contax in my pocket, I left the flashgun and bulbs in the cloakroom, and went into the lounge where everyone was arriving. Straight away I realised that candid shots were going to be very difficult indeed. The lighting was extremely yellow and rather dim. I had loaded up with I.S.S. and was using a Contax II with a 5-cm. f/1.5 Sonnar lens. There was no doubt that nothing faster than a tenth was going to give a printable negative, and if a block was to be made, it would mean a fifth. So a fifth it was at f/1.5. Before dinner only one chance presented itself, Mr. W. Briggs was talking to Mr. G. H. Potts, whose head was outlined against a chandelier in the distance. I shot at 9 ft. (see next page) and the almost silent shutter seemed to

scream as it closed, but I was the only person to hear it!

During dinner I was able to get one more shot and this was at Miss Yearby, one of the P.D.A. staff, sitting right opposite me. Not until she saw the camera ten minutes later did she suspect she had been caught. After dinner several people had realised I had my flashgun with me and asked me to show it them. As luck would have it, Lord Iliffe and Mr. Alec Hoare, the President

Above—LORD ILIFFE AND THE P.D.A. PRESIDENT, MR. ALEC HOARE, TALKING AFTER DINNER. Contax II, f/5.6, 1/200th sec. on I.S.S., Kalart speed flash with small Philips bulb.

Left—CANDID SHOT ACROSS THE DINNER TABLE. F/1.5, 1/5th sec.

of the Photographic Dealers' Association, were talking together, and I used the Kalart on the Contax to secure the picture. I used a 1/200th at f/5.6 for this shot with a small Philips Photoflux bulb.

Then came the cabaret. I set the shutter to 1/500th and lens to f/4.5, and sat on the edge of the dance floor. My first shot was rather unfortunate, one of the girls was coming down backwards from a hand stand and I cut off a foot. The other two were more successful. The one where one girl was swinging the other round had to be stopped down to f/11, because that hand was only 3 ft. from my lens. The other can be labelled as "satisfactory."

Two points I should like to mention. First, the Kalart had been working on my Leica during the afternoon, and it

CABARET. Contax II, f/4.5, I.S.S., Kalart with large bulb, 25 ft.

CABARET. Contax II, f/8. 1/1,250th sec. on I.S.S., Kalart with large bulb at 10 ft.

CABARET AFTER DINNER. THE GROSVENOR GIRLS.
Contax II, f 11 at 1/250th sec., I.S.S., Kalari speed
flash with large bulb at 12 ft.

took under a minute to put it on the Contax ready to shoot. The other is that my fifth bulb during the cabaret went off to the accompaniment of a crash of breaking glass in the middle of the floor. This, unfortunately, made everyone think it was a burst. It was not. It was only the playfulness of someone at the back of the room who threw a glass into the middle of the cabaret floor.

To take the photograph on the left I sat on the ground at the edge of the dance floor. When the girls came on I found they were going to do their stuff practically on top of me. Two members of the audience hastily moved aside for me, and I lay on my back on the floor, holding the camera upside-down with the flash-gun above it. Even so I was too near; I was told afterwards that the hands of the girl being swung round were certainly no farther off than my own feet.

MR. G. H. POTTS IN A THOUGHTFUL FRAME OF MIND.
Contax II, f 1.5, 1/5th sec.

THE CHAMPLIN 15 DEVELOPER

The following notes have been translated, and much abridged in the process, from two articles entitled "Das Champlin-Verfahren," by H. E. Wolff, which recently appeared in our German contemporary *Fotografische Rundschau*.

CHAMPLIN is an American experimenter who has been attempting to produce a developer which, while yielding as fine a grain as given by the special fine-grain developers, does not require that the film be given any extra exposure above that which it would require if it were intended to develop it in any ordinary developer. By trying to combine film speed, fine grain and absence of clogging in the high-lights, he arrived at a formula, called by him No. 7, which requires no extra exposure and has in consequence been very popular in America.

On the basis of this successful developer he conducted further experiments, and in the Champlin 15 developer he claims to have a product which gives grain as fine as that given by Sease III while permitting an exposure which is even less than normal.

To obtain the unusual advantages of the Champlin developer requires that the directions be scrupulously followed. This applies in particular to the weighing out of the sometimes minute quantities of the chemicals involved, for quite small errors, especially in weighing out the acids, can have very marked effects on the results. It is essential, too, that the substances used be chemically pure.

The Champlin 15 developer has the following formula:—

Distilled water	1,000 c.c.	20 oz.
Pyrogallol	3.5 grm.	31 grs.
Sodium sulphite (anhydrous)	60 grm.	530 grs.
Benzoic acid	1.2 grm.	10½ grs.
Salicylic acid	0.5 grm.	4½ grs.
Boric acid	2.5 grm.	22 grs.
Tannic acid	1 grm.	9 grs.
Glycin	11.5 grm.	100 grs.
Paraphenylene-diamine	11.5 grm.	100 grs.
Isopropyl alcohol, 97 per cent	50 c.c.	1 oz.
Nickel ammonium sulphate	1 grm.	9 grs.

The paraphenylene-diamine recommended is the Agfa brand or Merck's No. 7246.

Two small amounts of water of 100 c.c. and 30 c.c. (2 oz. and ¾ oz.) are separated from the main supply. In this, at about 85° Fahr. (30° C.) the accurately weighed out chemicals are dissolved in order. When the glycin is dissolved, dissolve the paraphenylene-diamine in the 100 c.c. (2 oz.) of water put on one side, this being heated to 160° to 175° Fahr. (70–80° C.) and add to the rest of the developer. Cool this then to 70° Fahr. (21° C.) and add the isopropyl alcohol. Meanwhile the nickel ammonium sulphate may have been dissolving in the 30 c.c. (¾ oz.) of water at room temperature; it will vanish more quickly if powdered in a mortar. When it is completely dissolved, add it *very slowly* to the developer, which must then be left to stand for half to one hour, by which time some precipitate will have settled and must then be filtered out. Champlin lays great stress on the filtration, which should be done through a proper chemical filter paper of close mesh.

The amount of developer made up should be stored in separate bottles, each holding an ounce or so more than is needed to fill the tank. Immediately after use it must be returned to the bottle for storage; each ½ litre (17–18 oz.) can be used four times, but must always be filtered again just before use. The grain of the first film developed is not quite so fine as that of the second and following films. There is no need to worry about the colour (first brownish, but later greenish); all that matters is that the solution should be clear and not cloudy.

As with all other paraphenylene-diamine developers, the solution produces intense brown stains on hands or clothes.

The developer is to be used at 21° C. (70° Fahr.) the first time, and at 23° C. (73° Fahr.) on second and subsequent use.

Times of development are as follows:—

Agfa Isopan F.F.	5 minutes.
Perutz Pergrano	5 "
Agfa Isochrom	6 "
Agfa Isopan F.	6 "
Perutz Neo-Persenso	6 "
Perutz Perpanitic	6 "
Kodak Panatomic	7 "
Voigtlander Bessapan S.F.	7 "
Kodak S.S. Pan.	8 "
Agfa Isopan I.S.S.	9 "
Kodak Super X	12½ "
Mimosa Panchroma	12½ "
Perutz Peromnia	12½ "
Zeiss Ikon Ortho	12½ "
Zeiss Ikon Panchrom.	12½ "
Voigtlander Bessapan F.	13½ "
Mimosa Extrema	16 "

All the above figures* refer to the first use of the developer at a temperature of 70° Fahr. (21° C.). At the second use, give the same time at 73° Fahr. (23° C.). For third and fourth use, again at this latter temperature, extend the time by 1½ and 3 minutes respectively.

Films developed in Champlin 15 require a hardening fixer, for which the following formula is given:—

Water	500 c.c.	20 oz.
Hypo	120 grm.	4 oz.

When completely dissolved add, separately and in order,

Sodium bisulphite	10 grm.	180 grs.
Chrome alum	10 grm.	180 grs.
Ammonium chloride	14 grm.	240 grs.

As this fixing bath does not keep, it must be thrown away after use. It may, however, be used for several films (up to 4) developed on the same day. It is a good plan to keep the hypo solution ready in bulk, making up the 500 c.c. or 20 oz. of final fixer required for the tank by adding the other three chemicals shortly before use. The materials are cheap enough; all that needs to be considered is the trouble involved.

(*Our own experience with Champlin 15 in conjunction with one of the films mentioned suggests that Mr. Wolff's development times are decidedly on the short side.—Ed.)

Modern Miniature Cameras

THE BALDAX.

THE Baldax is a neat, compact camera making 16 exposures, each approximately 4.5×6 cm. in size, on an 8-exposure spool of $3\frac{1}{2} \times 2\frac{1}{2}$ film. For the size of picture taken, the camera is, we think, as small as any we have seen, its dimensions being only $4\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in. thick over all projecting parts. It is thin enough to slip very comfortably into a hip pocket, and has a carrying handle at one end which makes its extraction from the pocket easy. The weight is only 17 oz.

In spite of its small size the Baldax has all the features that are expected in an instrument of its type. It is completely self-erecting, flying open briskly when the baseboard is released. The front locks firmly into position when extended. The model reviewed was fitted with a 7.5-cm. Meyer Trioplan lens of aperture f/3.5, mounted in a Compur Normal shutter, but the camera can be obtained with other lenses and shutters if desired.

Focussing is done by rotation of the front cell of the lens, the clearly-marked scale being graduated to 5 ft. For nearer distances a supplementary lens would be required. A depth-of-focus table for use in conjunction with the scale is affixed to the back of the camera. With the f/3.5 lens the Compur Normal shutter has a maximum speed of $1/3000$ second, but on the larger shutter necessitated by the alternative f/2.9 lens the highest speed is $1/2500$ second. Either lens can be had mounted in a Compur Rapid shutter speeded to $1/5000$ second.

As the design of the struts and supports holding the front of the camera is such as to make the normal trigger release of the shutter rather inaccessible, this is extended by a short lever. (Not shown in the illustration reproduced above.) The movement of this is greater than that of the original trigger, so making the release an exceptionally light one. We do not know whether this lever can be obtained as a separate item for attachment to Compur shutters on other cameras, but we hope it can, for there must be many older-pattern instruments still in use to which it might be fitted with advantage.

When the back of the camera is opened it is at once noticeable that no space whatever has been wasted. The width of the camera is just enough to admit the spools, and its length no more than that of the two spools and the picture opening, with just enough frame round the latter to support the film properly. The spool-chambers swing out, opening automatically as they do so, making the camera very easy and quick to load. A well-sprung pressure-plate is fitted, and ventilation is provided round the edges of the film to prevent it being sucked out of the focal plane as the camera opens. Sliding covers over the two red windows are provided, rendering the camera safe for panchromatic film.

The view-finder fitted is of the optical type using two lenses. It gives a large brilliant image, and the mask is well defined so that the boundaries of the picture can be determined accurately. When out of use it folds close against the body of the camera, springing up into position in response to pressure on a release button.

On test the camera was found very pleasant to handle, and the lens gave crisp definition at full aperture over the whole picture area. The metal edges of the camera, with other metal parts, are finished in nickel plate, and the body as a whole is leather covered.

With the lens and shutter mentioned, the Baldax costs £7 12s. 6d., or with f/2.9 Trioplan in delayed-action shutter, £9. In either case substitution of a Compur Rapid shutter for the Compur Normal adds £1 to the price. The camera can also be had with an f/4.5 Trioplan in Prontor II shutter (speeded 1 to $1/1750$ second), at £6 2s. 6d., or with an f/4.5 Vidanar anastigmat in three-speed shutter at £4 7s. 6d. The Baldax is obtainable from any dealer, and is imported by the Norse Trading Company (London) Ltd., of 37, Rathbone Street, W.1.

Miniature Camera Gossip

By LANCELOT VINING.

THIS challenge recently arrived through the post. Could I photograph the passing of the water between a jug and a glass, which were to be held not farther than 18 inches apart, and "stop" the water half-way between the two? I was evidently not meant to attempt this in daylight. I determined to use my $5\frac{1}{8}$ -in. Sonnar at 5 ft. (its limit), as this gave me half the glass and half the jug, with a little less than 18 inches between them. I used the Mendelsohn and a Photoflux lamp with f/5.6 at $1/1,250$ th on I.S.S. film. Camera was held in the hand. I was too early the first shot, too late the next and the third is reproduced here.

Complete Failure.

Not long ago I was invited to photograph with synchronised flash the finish of an important dog race at the White City. I do not remember ever having given $1/1,250$ th in the open at night before, but thought that if I opened up to f/2 I ought to just about get a result; this was based on my experience of indoor exposures. The result was just *nil* or very little better, and was certainly not worth printing; everything worked well and I have no reason to doubt the lamp. Indeed, an observer in the stand, who is used to flashlight, said my flash was a good one.

My luck was not quite as bad as it sounds, for the stars for the day said my lucky number was six and my colour blue. By combining the dogs in trap

WATER.

The photograph shows water being poured from a jug into a glass 18 in. below it. Taken at 5 ft., with $5\frac{1}{8}$ -in. Sonnar. Exp., $1/1,250$ th sec. at f/5.6. Flash-gun.

kept her figure, which I had heard was the envy of many stars down Pinewood way. She certainly was not dieting. I was

invited to visit the club swimming-pool at 3 p.m. and learn her secret; this I did, and I obtained a fine set of pictures of her using a rowing exerciser, followed by a little artificial sun. It is all very easy, but can I find that daily ten minutes? It's just about the difference between D76 and Metol-Meritol, but I do like the latter.

Flash-Lamp Demonstration.

The demonstration of synchronised flash-lamps, to which I have referred in the two previous issues of "The A.P.," will be held at The Camera Club, 17, John Street, Adelphi, at 6.30 p.m. on Monday, November 22nd. To those who do not know the Camera Club, John Street is directly behind the Tivoli in the Strand, and No. 17 is next door to "The Little Theatre."

Above photographs reproduced by courtesy of "The Daily Mirror."

A Modest Miniature in Winter

By R. E. BLAKENEY.

THE MODEL ENGINEER. 11 a.m., January, cloudy.
1/10th at f/3.5, Selo F.G. Pan. film.

WINTER photography, even in a town, does not necessarily call for the excessive apertures of the more elaborate miniature, although it must be admitted that it would be pleasant to possess a camera of such tremendous potentialities. My own miniature was bought to replace a 9 x 12 cm. camera, with which I found photography an expensive hobby. So

when an advertisement in "The A.P." caught my eye, I bought a second-hand Nagel Vollenda for £3 19s. 6d. It had an f/3.5 lens, a Compur shutter and gave 16 exposures on 127 size film.

Focussing Difficulties Overcome.

This gave me the opportunity of experimenting at a reasonable cost, and vastly increased my range of subjects. At first I doubted my ability accurately to judge distances and then focus by scale, but soon found that it was not nearly as difficult as I had imagined.

I use a photo-electric exposure meter as a matter of course, taking care to modify the information gained to suit the subject. The occasions when an aperture of f/3.5 is not large enough to permit of snapshot exposures I found surprisingly few, even in winter. Out of doors there always seems light enough at any time when any ordinary person would want to take a photograph, and even indoors snapshots are possible.

SERVICE No. 60. 1 p.m., December, dull light.
1/10th at f/3.5, Selo F.G. Pan. film.

ACHILLES. 9.30 a.m., February. 1/50th at f/8, Panatomic film, G.R.5 filter.

An exposure of 1/5th to 1/10th at f/3.5, using a fine-grain panchromatic film, seems ample in a well-lighted room. Such exposures do not call for a rest if one sits in an armchair, and from this stronghold any number of interesting shots can be made unobserved. Later in the day one can change over to one of the hyper-sensitive panchromatic films and, with quite ordinary lighting, give 1/2 to 1/5th of a second at full aperture. If a single Photoflood is used I find 1/25th of a second sufficient.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

MINIATURE DIFFICULTIES.

I am at present using a 3 1/2 x 2 1/4 camera, but am considering a change to the real miniature class—i.e., 35-mm. film. But it seems that rather special difficulties arise, and rather special methods have to be used. Is this the case? And where could I find details for my guidance? A. M. S. (Leeds.)

The technique of 35-mm. photography is only different from that involved in making larger negatives by virtue of the fact that a special developer has to be used, and the work has to be really carefully done. There is nothing in the least difficult about the processing; anyone who will conscientiously follow instructions absolutely to the letter can produce perfectly developed miniature negatives at the first trial. But there is no latitude whatever for careless or slipshod working. You will find the "Leica Manual" (Fountain Press, 21s.) an admirable guide to methods of processing, as well as to much else.

FITTING ENLARGING ATTACHMENT.

I have a Dollina 11 range-finder camera, and wish to use it as part of an enlarger, in conjunction with the "Mirax" attachment. Is this practicable? And would the heat of the lamp harm the lens in any way? A. K. B. (Cardiff.)

So far as we know your Dollina camera can quite satisfactorily be used with a Mirax enlarging attachment, but so many mechanical details are involved in a question of this sort that we could not possibly answer it definitely without having both pieces of apparatus here. We suggest that you put your query to Messrs. Zeiss Ikon, Ltd., 25-27, Berners Street, London, W.1, the makers of the Mirax attachment.

You need not fear that the heat of the lamp would have any detrimental effect either on the lens or the camera.

PHOTO-CELL DISCREPANCIES.

Accurate exposure is the foundation of miniature photography, so I want an accurate exposure meter. I thought a photo-cell meter would be suitable until I compared several and found they all indicated different exposures. In view of this, is such a meter worth buying? F. S. (Lincoln.)

In our opinion, a photo-electric exposure meter is an extremely good investment, and we do not think you need be deterred from buying one by the fact that, on comparing several, they indicate different exposures. That is inevitable, because opinions as to what constitutes a perfect negative vary very widely. The usual procedure with a photo-electric meter is to increase or decrease the normal speed number of your film until you get the type of negative you like, whereupon adherence to the readings of the meter will regularly give you that kind of negative from every exposure.

SPOTS AND BLEMISHES.

I recently obtained an Ensign Midget camera, but find that spots and other marks appear on my prints. I enclose two of these, and should be glad if you can help me. J. P. F. (Wallasey.)

The prints you send strongly suggest that the white spots and marks are due to dust or dirt on the negative, either during exposure or development, or more probably at the time of making the enlargements. With careful working in the dark-room they should not arise.

INTERCHANGEABLE LENSES.

I have a Leica, for which I have just bought a 9-cm. lens. Is the view seen through the range-finder less or more than this lens includes? Should I give the same exposure with this lens at f/4 as with the ordinary 5-cm. lens? And will my photo-cell meter be suitable for use with it? V. H. (Buenos Aires.)

The view seen through the range-finder of a Leica camera includes very much less of the subject than would a photograph taken with a 9-cm. lens. For determining the exact angle of view you will need an auxiliary view-finder, which slips into the shoe on the top of the camera.

The exposure required for the 9-cm. lens at f/4 is the same as that required by the 5-cm. lens at f/4, the exposure in both cases to be based on the brightness of the subject included by both lenses.

With the long-focus lens you can quite safely continue to use your photo-electric meter in the same way as you have previously used it with a short-focus lens.

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

No. CDXII.

Mr. JAMES C.
GILCHRIST.

"I MAY begin by stating that I am an old-fashioned photographer, and I have, during this stage of new-angle photography, high-speed precision instruments and fine-grain developers, pursued the even tenor of my way. I have taken what was pleasing to myself, and what I thought was artistic, rather than what I considered likely to please judges with distorted views on art, and who failed to see beauty unless displayed from an unusual point of view, or treated in a so-called original manner.

"I have a great admiration for the work of the photographers of thirty or forty years ago, who turned out such excellent pictures without all the present-day aids to easy photography. Recently I happened to be looking over some seascapes by the present editor of 'The A.P.', and some still-lives by J. M. Whitehead, which

appeared in *Country Life* in 1904, and I could not help but admire the excellence of the work both from the technical and pictorial aspect.

"At that time I was a very keen photographer in a modest way, and had a certain measure of success; but I gave up all attempts at exhibition work until I staged a come-back three years ago. So far I have not resorted to faking to get results, even in such a simple matter as printing-in clouds.

"I must confess that I would rather spend hours in the open getting the effect I want than hours at home making a picture out of nothing. The only faking I have done is with table-top work, when there is no pretence at straight photography and almost anything in the way of dodging is permissible.

"My favourite and most-used cam-

era is a $3\frac{1}{2} \times 2\frac{1}{2}$ Ensign Special reflex with Zeiss f/2.7 lens. I have an alternative Ross 11-in. Telephoto which comes in very useful at times. I do not confine myself to any particular subjects, but try to make a picture of anything that comes to hand. I find my car very useful for getting to a suitable district, where I hunt around for possible pictures. If the light is not suitable I return again and again. Some days are lucky; everything seems to go right; while on other days you may have a very nice composition, when the sun goes in, and stays in. But the charm lies in the work not being too easy, and in being very largely dependent on luck—good, bad and indifferent.

"I use almost entirely Ilford S.G. Panchromatic backed, and dish development with Kodak Special developer, time and temperature, with a glance now and then to watch progress. I print off on a self-toning paper, and enlarge the more promising results on either bromide or chlorobromide, and I find I get a larger percentage of good results from the latter. It is a first-rate printing process, and there is no wonder that it has become so popular for exhibition work.

"To those of us who have not easy access to study the work of experts in the exhibitions the reproductions which appear in 'The A.P.' and in *Photograms of the Year* are very helpful. I send my best efforts to 'The A.P.' monthly competition, and very much appreciate the criticisms, which are always well thought out and encouraging. I am very glad to see that 'Mentor,' in his critical comments on 'Pictures by Novices,' is discouraging the striving after effect by taking pictures from anything but the eye-level, and that the tendency in exhibitions is to return to sanity."

(A further example of Mr. Gilchrist's work is reproduced on one of the centre Art pages.)

SNOWY DRIFT.

James C. Gilchrist.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"TWO GIANTS," by Wei Nan-Ch'ang.

THIS is a picture that is interesting inasmuch as it betrays a method of treatment, a choice of material and a motive which arise from its Eastern origin and which cause it to differ appreciably from our conception of what a pictorial representation should be. It is foreign in its aspect, naturally, but it is not without elements of attraction regarded purely from our Western point of view.

As far as the motive is concerned, it appears to lie in the effect of light on the trunks of the two trees. The brilliance is extraordinarily well suggested and is very considerably stressed by the depth of tone in the adjoining sky and adjacent foliage. It is most forcefully put forward, but, to our view, the contrast of tone seems appreciably exaggerated. If it came from a Western source, I should be inclined to criticise such a rendering as one so far in excess of the fact that it could only be regarded as conflicting with realism and therefore false; but, for all I know, such an impression may be sought for designedly by Chinese artists. It may even represent their ideal of pictorial interpretation, and, if so, it might possibly be accepted with reserve as an Eastern idiosyncrasy, but one which we should prefer not to emulate.

Similarly, in connection with the arrangement, the trunks of the two trees, falling, as they do, athwart two of the points of intersection formed by divisions of thirds, would seem to us to be strongly and properly placed and just as they should be in order to serve their function in providing the centre of interest.

But they have no foundation. They start below the base of the picture and are devoid of the stability they would possess if their roots and a bit of foreground were shown on which they could comfortably rest. Stability is not altogether lacking, it is true, but what there is arises from the strip

of landscape along the bottom of the print, and that is barely enough to sustain the weight of tone at the top. It scarcely affects the trees themselves, and, though I feel I can extend a sort of charitable latitude in cases where a "new angle" stunt is applied to building or street scenes, I do not think that landscape is a suitable subject for such methods of treatment, and am of the opinion that, as a

regard it as unacceptable, unless, perchance, it were otherwise justifiable.

From the technical standpoint, too, I should be inclined to regard the tone of the sky, in comparison with the light on the trees and the general tone of the landscape below, as a result either of over-development or an unsuitable printing paper, or, possibly, of the use of an inappropriate light filter. I have seen similar effects when an infra-red screen has been employed, and would expect something of the sort if an orange or red filter were used in conjunction with a panchromatic plate or film when the screen designed by the makers to afford full correction is a moderately deep yellow or green.

However, it is only of late years that the Chinese have made any contribution at all to pictorial photography. They are late in the field, and it may be some little time before they are able to reconcile their traditional ideals of art with the rendering the camera affords. Nevertheless, an example such as this, from a comparative new-comer, is very welcome, and encourages us to hope that that nation will soon take an equal place with the rest in our well-established international exhibitions.

Incidentally, it may be mentioned that this picture was one of a number of others from Eastern sources that were shown at the London Salon of Photography in their last show, and in *Photograms of the Year*, which will be available early in December, other examples are reproduced.

These go to show how widely the practice of pictorial photography is now extended, but having regard to the avoidance of any form of perspective, which, I understand, is a characteristic of Chinese drawing, I shall be rather intrigued to see how their camera work, with its strictly accurate and natural perspective, develops.

"MENTOR."

general rule, the bases of trees should be included. A point such as this, to the Eastern mind, might be viewed as of little moment, but to us, with the traditions of Constable and the great British masters of landscape, it is important, and one that cannot be lightly disregarded. So that, while refraining from saying that this example is definitely wrong or ill advised, I must point out that did a similar arrangement come before me from a Western source, I should

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

WITH a subject like No. 1 of the prints reproduced on the opposite page—"Lake Thun," by Miss V. A. Barratt—the reflections play so important a part that I am more than a bit doubtful of the wisdom of including the boats in the foreground.

Studies of Reflections.

If the water were rough and there were no reflections, the boats would probably prove extremely useful in providing a diversion at the bottom of the print, but, in this instance, the water is smooth enough to show very pleasing repetitions—with a wiggle-waggle—of the light-toned buildings above, and I think a good deal more should have been made of them.

Even now, if I were dealing with the subject myself, I would trim along the base so as just to remove the boats, and, because the building on the extreme left is somewhat assertive for its position, I would take that away also. The remaining portion makes a far better composition than the whole, and, while it may be small, the definition seems to be quite good enough to stand enlargement up to about 10×8 inches, that is, of course, if so much should be required.

And, if the practice of enlargement has not yet been essayed, now is the time to make a start. It is all very well, in the summer-time, to go out and get our subjects and be content with contact prints, but these should only be regarded as proofs and kept as guides for the really serious work of making enlargements later on, when the opportunity for outdoor work is greatly restricted.

Exhibition Prints.

Whether a subject like the revised version of No. 1 could be made into an exhibition print or not depends upon the way it was worked up and finished.

It could not, however, be shown in its present size, and, necessarily, would have to be enlarged to enable it to tell to proper effect upon the exhibition wall, but, whether intended for show or not, there is no doubt whatever but that enlargement would bring out its full attraction to an extent that is quite impossible in the smaller print.

"Clovelly" (2), by W. L. Watts, shows a better idea of the way boats

should be displayed in a subject of similar nature, but, unfortunately, the water is too smooth and the reflections too nearly a precise imitation to present the same appeal as they do in the foregoing instance. The definition of the image is not so good, and I am afraid it would not be possible to enlarge it to the same degree without fuzziness becoming unpleasantly apparent.

With No. 3, "Sunlight and Shadows," by John E. Vautier, there is no sign of a like disability, and the definition is quite as clear cut and sharp as was the case with No. 1. The subject is nicely chosen, and the motive of sunlight is very well brought forward.

But the depth of tone in the upper portion of the print is excessive, and, were there any intention to make a larger print of it, it would be essential to choose a very soft grade of paper in order that those darks might be shown with a fuller range of modulation. It is possible that this expedient would enable gradation to be revealed that is now choked up, and, if so, the print would be all the better for it.

Weight of Tone.

The present feeling is that the print is too top heavy. The substitution of printing paper might diminish this impression on account of the additional relief that might be expected, but, if not, there would appear to be no alternative but to restrict the weight of tone by reducing its area.

A trim of three-eighths of an inch should be enough, and would bring the somewhat long shape of the print nearer to the usually acceptable proportions of five to four, to which, apart from exceptional subjects, most exhibition prints conform.

The contrasts of No. 4, "Wastdale Head," by J. D. Pickup, are also rather too extended, and, here again, I think a rendering on a softer grade of paper would be considerably more satisfying. It should enable a greater amount of tone to be recorded in the sky; the distance, similarly, would have a bit more weight, and, at the other end of the scale, the darks would display more distinction of tone and not prove so assertive. I am not altogether sure that the inclusion of the figure is an advantage, particularly

having regard to its placing, and should have thought a better position would have been towards the nearer end of the bridge. The best placing of figures in a picture is a most important matter, and always demands careful consideration.

Viewing Distance.

It is apparent, however, that, if the figure were so placed, it would be necessary for a more distant viewpoint to be adopted, for otherwise it would be out of proportion and would tend to dwarf the landscape. This is another important point.

In any case, and whether a figure be introduced or not, the more distant point of view is to be preferred, if only on the ground that, as at present disposed, it is inclined to take up too much of the foreground. A similar recommendation could well be made in the case of No. 5, "The Crypt, Wells," by E. Verdin, for, here, not only are the bases of the near group of pillars cut off, but so are the points of most of the arches at the top.

I should not be surprised to learn that space was very confined and that a greater viewing distance was impossible to obtain. If so, the subject is one that could only be properly attempted with the aid of a wide-angle lens, i.e., if the horizontal picture is regarded as essential. Otherwise, if the subject seemed acceptable as a vertical and so much width was not desired, it might possibly offer an improvement if so treated.

Good Workmanship.

At all events, the print displays excellent workmanship, and, keeping in mind its difficulties, it compares favourably with any other on the page.

On the other hand, No. 6, "The Man at the Wheel," by P. Hoare, reverts to that excess of contrast which appreciably detracted from the renderings of Nos. 3 and 4, and, as in those cases, recourse must be made to a softer type of paper. In this instance, however, it is the lights and not the darks that are deficient in modulation, and the change of paper will enable them to be more fully printed—which is what they need—without involving an increase in the depth of the shadow tone.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

TANKING A SPOOL OF FILM.

It is probable that the sensitive material most used by beginners is the spool of roll film that takes eight $3\frac{1}{2} \times 2\frac{1}{4}$ negatives, or sixteen half the size. Of those who are wise enough to develop these spools themselves a large number adopt the see-saw method, but although this can be managed successfully with care it is decidedly inferior to the tank method. It certainly pays to invest in a suitable tank, and to standardise the process of development.

Although I mention a $2\frac{1}{4}$ -in. spool, the method of tank development can be applied to all roll films, to cut films, and to film packs; but in my opinion it is particularly desirable in the case of roll films. It may be added that all tank development, whatever the form of the sensitive material, is based on the principle of time and temperature development.

I have developed many roll films in tanks, but for the purpose of these notes I mentally placed myself in the position of a beginner who is carrying out the operations

made this up, and hung a thermometer in the solution.

In the second column of the table were three letters indicating the three classes into which films had been divided according to their speed of development. Some films require $1\frac{1}{2}$ to 2 times the development time of others to reach the same degree of contrast. Another table in the diary told me at a glance in which one of the three classes to place the film I had exposed for the purpose.

Next in the table came seven columns giving the times of development for seven different temperatures. I glanced at the thermometer, and found that the time suggested was $16\frac{1}{2}$ minutes. From previous experience of Rytol I guessed that I should give about half as long again to get the sort of negatives I required.

Winding the film into the tank, and pouring in the developer, I looked at the time and developed for 24 minutes. Then I poured out the developer, filled the tank

for the first time. It added a touch of realism that I was using a tank of which I had no previous experience.

The first thing was to "learn" the tank. This meant studying the instructions and diagrams, and going through all the movements until I knew them from beginning to end. Then I fished out an ancient exposed film, and put it through the tank with the lid off to see exactly what happened. In the ordinary way this would be an unnecessary extravagance, but I was glad of an excuse to get rid of that film, which had been looking reproachfully at me for years.

As I intended to develop with Rytol I got out my "Wellcome" diary, turned up the table giving various strengths and quantities of solution, and selected one of those recommended—two pairs of tabloids in 16 oz. of water. I

with water and emptied it three times, and then took out the spindle carrying the film (in very dim light) and stood it in a jar of fixing-hardening solution. In the end I hung up a spool of eight good negatives. With modern bakelite tanks I see no objection to fixing and washing also in the tank.

It is evident that the following data are required. (a) The quantity, character and strength of the developing solution; (b) the temperature at which it is to be used; (c) the classification of the film according to the rate at which it acquires a certain degree of contrast; (d) the time of development necessary to produce the kind of negatives required.

The first three items are sufficiently definite to be obtained from tables available not only in the "Wellcome" diary but elsewhere. It is the fourth item that must be modified as necessary by the photographer. Had I taken the time given in the table I should have obtained good negatives, but they would have been too soft and delicate for my purpose. But they would not have been useless; I could have used a more vigorous paper for them, or I could have increased contrast by bleaching and redeveloping.

I show four small prints from the spool. In making the exposures, all within a short distance, I used different stops and shutter speeds, but in each case aimed at an exposure within the limits of safety. When this is done

the negatives will be even in density, and differences in contrast will be due to the contrasts of the subjects themselves.

The only snag in the method is that it is not possible to vary the time of development for this or that negative in the series; and after all this is very seldom a matter of vital importance.

W. L. F. W.

INTENSIFYING A PRINT

THE best of us sometimes turn out a print which is disappointingly on the flat side. Whatever the cause, it is comforting to know that such a print need not be thrown away, but can be quite easily intensified to a satisfactory contrast. If each portion of the annexed illustration be covered up in turn along the dividing line the improvement will be fully realised.

The method is simple in the extreme, and it requires no formula! But it does demand that the print shall have been completely fixed in fresh hypo solution, and that the latter should have been completely washed out again. The intensifier consists of a pale solution of bichromate of potash into which a few drops of hydrochloric acid (ordinary "spirits of salts") have been well stirred. In this acid bichromate the print should bleach until only a cream-coloured image is left. If it does not, addition to the solution of a few more drops of acid will make it work.

This print was cut in two and the top half intensified by the method described in the article on this page. The lower half shows tone of the original print.

Too much acid will give less final intensification.

When bleaching is complete, the yellow bichromate colour must be washed out, and the print is redeveloped in any ordinary print developer such as amidol or M.Q., after which the desired improvement should be evident, and following another short wash the print can be pinned up to dry.

If, on the other hand, one would like to see still further brightening, the whole process may be repeated, and the repetition will give a further increase of density. There is no need to fix the print again after redevelopment, and it is interesting to know that a pale, or a "gingery" sepia-toned bromide print can be satisfactorily intensified.

On the other hand, it is very important that the print shall have been free from fog in the first place. For any fog will be intensified along with the rest of the silver deposit and would make the final result look very dingy indeed. D. C.

MAKING BETTER SNAPSHOTS-24

By DAVID CHARLES.

This article is the twenty-fourth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. The tree would make a good "frame" to this November scene if the foreground were simpler.

OLD traditions die hard. But the sooner the one that November puts an end to picture-making dies the better. I had often seen this group of chimneys from the morning train and wondered if "anything could be done" with it. Then early in the morning on the day of the last Lord Mayor's Show, I had to go on foot in that very direction. It nearly always rains for the Lord Mayor's Show, but that was a particularly nasty one, with a continuous fine drizzle.

An Effect of Mystery.

But this did not succeed in damping my spirits, for instead of the familiar ugly black columns upon an ugly black block there seemed to be an effect of gently veiling mystery, due of course to that very drizzle. Needless to say I might not have felt quite so happy about having an hour to wait in the rain if a camera, charged with panchromatic film of the very fastest, had not been slung over my shoulder. Its lens was a long

Fig. 3. A different standpoint often presents an entirely altered picture of the same subject.

way from being the fastest, however, for $f/4.5$ was its biggest stop, but with a twenty-fifth of a second I bagged quite a nice little selection between eight o'clock and half-past.

For the benefit of box and other snapshot camera owners it should be pointed out that with the aid of a reasonably firm stand they could obtain precisely similar pictures in the same conditions. It would only be necessary to set the shutter at T., or at B., according to its variety,

To me it is that haze over the distant buildings which makes it look far away and mysterious.

Foreground Too "Busy."

Of course, the contrast with the silhouetted tree in Fig. 1 does accentuate that effect of distance, but the whole foreground is much too "bitty" for my liking. Even if one were to trim off the railings on the left it still remains rather a jumble. It is obvious that Fig. 2 was made from a spot farther along the Embankment towards this old power station. This print shows the whole of the negative, as taken, but by cutting off that serrated appearance on

the right there results a simple effect which, to me, at any rate, seems to reflect the sad emptiness of a damp November morning.

Getting nearer still the scene changes again, as it usually does. In fact, I made no less than nine studies of that pile of old chimneys, and each and every one of them entirely different, "chill November" though it

Fig. 2. The misty distance and the simple design convey the sense of dreariness characteristic of the river in November.

and then to open and shut it as quickly as possible, for there is nothing in the subject to move during the exposure.

Filter or Not?

It is always a moot point as to whether a filter is or is not desirable to "cut out" the mist and the

rain in making these riverside pictures. Personally, I think not; at all events no filter was used in taking the photographs that illustrate this article. In my experience, entirely to remove the effect of rain and mist is all very well if the photograph is being taken for business purposes or, perhaps, to prove in a Court of Justice that somebody was "in the wrong." But if one is out to capture the spirit of the scene as the eye sees it, then I think that good panchromatic film does unaided all that one can wish in that direction.

Fig. 4. Still more changes can be rung on the scene in the dark-room. This is "enlarged out" from No. 3.

was. My whole point is that there is no "close season" for the camera, as there is for the gun, or for the rod-and-line. But each season presents some kinds of subjects and of effects which just cannot be got at other times, and offers opportunities which, if missed, will not recur for another year.

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Amateur Cinematography

Winter Programmes By D. CHARLES OTTLEY.

AMATEUR cinematography divides itself roughly into two periods, each separate and distinct one from the other. The first of these may be called the taking period and the second the showing period. Generally speaking the former occupies from six to nine months, while the latter enjoys full prominence any time between October and March.

Learning from the Screen.

Even where enthusiasm runs so high as to favour the making of films the whole year round, it is advisable to call at least a temporary halt, because so much that is of value in taking films may be learned from showing films and again from watching them. It is a fact that, no matter how satisfying a picture made twelve months ago may have appeared at the time, its solitary confinement to the humid tin for that period does not usually improve its æsthetic and technical perfection when shown again.

The truth is that we as individuals cannot escape the natural progress that the continued use of a ciné camera is certain to ensure, and whereas each completed picture is a milestone dumped on the way, we, the travellers, do not pitch our camp beside it.

The showing period, the brief days and long evenings that begin with the fogs of November, provide the opportunity of comparing past achievements with present efforts, and together the necessary impetus is gained to carry us forward yet another year in quest of all that is most inspiring and worthy in a fascinating hobby.

If there be an art in making films, there is also an art in projecting them, and while the technical aspect of the latter is fairly generally appreciated, a few words upon the æsthetic aspect may not be out of place.

Consider the Audience.

It is quite wrong to think of the programme only from the point of view of the person presenting it. The peculiar constitution of your audience should be borne in mind and if this differs widely, a series of "specialist" programmes should be given rather than an attempt at an "all-in" entertainment that will delight some and bore others. Instead of giving just a "film show," with no very definite idea as to what you are going to project or how you are going to project it, decide upon a common theme and devote your entire available repertoire to its adequate development.

"An Evening of Mystery" might provide the frame for effectively presenting films of the "Caligari" type. The

arrangement of the various items constituting the programme should be linked together in much the same way that shots are linked in a film sequence.

Providing Atmosphere.

Suitable music is available on records, plus dramatic interludes such as the "Murder Scene from Macbeth," or that particularly eerie thriller, "The Wrong Bus." Travel films of sinister places and people, such as the "Tombs of Thebes" or "Indian Mystics" fit in quite well with the prevailing atmosphere, and the final touches are added by a careful arrangement of lights.

Consider a film such as "White Cargo." A programme featuring this might be named "An Evening in the South Seas." Constant Lambert's "Rio Grande," plus a selection of sea shanties, would produce just the right atmosphere for that strange drama enacted "south of the line."

The Gaiety of Paris.

Films of fantasy, of dancing, and of my lady in her most alluring draperies fit in with a Parisian atmosphere. So

does a film such as "Le Moulin Rouge." These, plus a record of "L'Après-midi d'un Faune" blend nicely under such a title as "An Evening in Paris," and while in Paris there is nothing whatever against a brief tour of its chief centres of interest. Here, then, can be introduced a travel film, if you possess one.

Historical London.

"A London Evening" offers infinite scope, particularly for those who have personal films showing one aspect or another of its myriad attractions. To the music of Eric Coates' "London Suite," particularly "The Knightsbridge March," an interest or travel film might start the programme, followed by a characteristic tableau-vivant "Old London Cries," or the late Wish Wynne's "Embankment Impression." A place might be made for the four-part recording of "Sweeney Tod," in which Mr. Slaughter and Company excel themselves, followed by such a film as "Oliver Twist" or "Little Dorrit." Persuade your sisters (or somebody else's!) to dress as Dickens' characters and the atmosphere is complete.

A good "Rugger" match on a bright afternoon affords plenty of scope for the amateur cinematographer in search of action pictures at the present time. A position on the touch-line is best, and the game provides one of the few subjects where rapid panning, to follow a player or the ball, can be tried successfully.

Aids to Editing By NORMAN DYER.

NOW that the editing season is in full swing, and most amateurs are, it is hoped, trying to get the footage shot during the summer into presentable shape, some hints on the purely mechanical side of the task may be of some interest. Essentially, of course, the main problem consists of joining up the various lengths of film with joins or "splices." These must be strong and permanent, so that there shall never be any of those annoying breaks which so easily spoil a show, and they must be well enough made not to show on the screen.

Equipment for Editing.

The essential apparatus needed to produce these results consists of a joining press, or "splicer" as it is called, a bottle of film cement, and a pair of scissors. Splicers, which consist of a baseboard with registration pins to hold the film in true alignment, and several clamps which securely hold the film down while the splice is setting, may be obtained in models from a few shillings to several pounds, the difference being in various refinements making for speed and ease of operation. Most splicers are provided with a cutter for cutting the film and a scraper for removing the emulsion at the join. Film cement can be obtained either in special brands for different makes of film, or as universal cement suitable for all makes of sub-standard film.

The Mechanics of Splicing.

Film cement is actually a solvent of the base (cellulose acetate) of ciné film, and the operation of making a splice consists of applying a small amount to the two ends to be joined, which are then clamped together under pressure, the two pieces of film being thus fused together. In order to bring the two bases together, it is obvious that the emulsion at the join must be removed;

this can be done on the scraper mentioned above, or, if one is not fitted, the end of the film can be passed over the tip of the tongue and the emulsion then scraped off with a penknife. To ensure a perfect join, the other (base) surface of the join should also be lightly scraped to remove any dirt or grease.

Although the above apparatus, coupled with a little easily acquired operating skill, is all that is necessary for the rapid production of perfect splices, there are one or two additional pieces of apparatus which help to make the task of editing easier, the most important of which is a rewinder.

An Editing Bench.

Essentially this need consist of no more than a baseboard, at each end of which is mounted a geared winder operated by a handle. It is also usual to mount the splicer on the baseboard between the two winders. This arrangement makes for great efficiency in editing, as after the first rough assembly on to the super reel, the film can be wound backwards and forwards and the final cutting performed. Now rewinders unfortunately cost a good deal of money, and so the amateur will doubtless wish to make his own. This can actually be accomplished at the cost of a few shillings as follows. The baseboard, which should be about two feet long and wide enough to accommodate the splicer, can be made of any good strong piece of wood. For the geared rewinds recourse must be had to the by now proverbial threepenny and sixpenny stores, where the geared portions of small grindstones may be purchased. One should be mounted at each end of the baseboard on a platform, and, with the addition of a little stain, the rewinder is complete.

In editing a film consisting of a large number of separate shots which may be spread over many small reels, some difficulty usually arises in finding a

particular shot when required. For this purpose it is usual to provide an editing rack, which may consist of a row of numbered pins on which the strips of film can be hung in order of assembly. The actual details will depend, of course, on the particular room in which the editing is being carried out; when it must be confined to a table it can be replaced by a partitioned box, in which the strips of film are coiled.

Annoyances Avoided.

With the simple equipment described the task of editing a film, which can be most tedious and exasperating if these conveniences are not to hand, is made quite simple on the mechanical side. Without them, even for a simple splice, the unfortunate operator finds it impossibly difficult to hold the reels while he manipulates the springy ends that he is trying to join together, and the result of working under such awkward conditions is that the splices, when made, are bad, the films are not cemented over the whole overlapping surfaces, and the perforations are not exactly spaced. Breakage in the projector is therefore more than likely. In addition, the work of editing becomes unpleasant, and is shirked when proper facilities are lacking, and the presentation of the material is less good than it should be.

Time Used, not Wasted.

It is true that time usefully spent in editing a film should never be grudged, as the success of the finished product depends almost as much on the editing as on the taking. But time wasted through lack of the necessary equipment is another matter; it adds nothing to the final result, and only irritates and exasperates the editor. With the aid of the simple accessories described the task of editing is made easy and pleasant, besides being much simplified and speeded up.

Exhibitions and Competitions CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, November 30. Rules in the issue of October 27.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Folkestone C.C. Exhibition of Photography.—Open, October 23–December 4. (A. J. Stewart, 25, Guildhall Street, Folkestone.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

International Salon Oval Table Society, Inc.—Open, November 16–30. (Oval Table Society Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography. Open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

XIe International Fotosalon "Iris"—Open, January, 1938; last day for prints and entry forms, Nov-

ember 30, 1937. (F. Geeraerts, Brederodestr, 22, Antwerp, Belgium.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Aberdeen P.A. International Exhibition of Photographic Art.—Entries, January 15, 1938; open, February 5–26. (Miss Hilda N. Bailey, 63, Watson Street, Aberdeen.)

Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7–12. (I. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31; open, March 7–12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)

L.M.S. (London) P.S. 13th Annual Exhibition.—Entries, February 1; open, March 7–12. (Hon. Exhibition Secretary, L.M.S. (London) Photographic Society, 1, Euston Square, London, N.W.1.)

City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday, February 7; open, March 7–12, 1938. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April, 1938. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Scottish Photographic Federation 30th Scottish National Salon.—Entries, March 2; open, April 2–16. (Percy H. Cartwright, 52, High Street, Galashiels, Scotland.)

Hackney P.S. 49th Annual Exhibition.—Entries, March 7; open, March 30–April 2, 1938. (Walter Selfe, 9, Fairlight Avenue, Woodford Green, Essex.)

XVIIe Salon International de Photographie de Belgique.—Entries, April 1; open, May–October, 1938. (J. Lejeune, 70, Avenue Van Becelaere, Boitsfort, Brussels, Belgium.)

November 17th, 1937

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Thursday, November 18th.

Amateur Cinematographers' Assoc. Arrangements for Public Show. Ladies' Night.
Accrington C.C. "Norway." Miss Wells.
Armley and Wortley P.S. "China Seas." J. M. Kitchen.
Aston P.S. Development Night.
Bayswater and Padd. P.S. "Table Top and Other Topics." E. Heinmann.
Blyth and D.C.C. "Oil Reinforcement." W. F. T. Pinkney.
Bolton C.C. "Canterbury and its Cathedral." J. B. Statters.
Brighton and Hove C.C. Annual Dinner.
Bury P.S. "Flashlight Photography Demonstration." J. A. Speed.
Camberwell C.C. Auction Sale.
Coatbridge P.A. G.D.U. Slides and S.P.F. Colour Slides.
Gateshead and D.C.C. "Practical Photography." H. H. Johnston.
Greenock C.C. "Portraiture." W. W. Weir.
Hampshire House P.S. "Mine and Mask." H. D. C. Pepler.
Handsworth P.S. Inter-Club Competition.
Herefordshire P.S. Visit from Leominster Photographic Society.
Hull P.S. "Holiday Reminiscences." W. Morley.
Isle of Wight C.C. "Spain in Nature's Glowing Colours."
Keighley and D.P.A. "A Tour Round an Old Garden." A. Keighley.
Kentish Town P.C. "Materials, what to use and why."
Leominster P.S. Visit to Hereford P.S.
Liverpool A.P.A. "Over the Sea to Skye." W. A. Gibson Martin.
Loughborough P.S. "Picture from the Orient."
Medway A.P.A. "Bird Nesting with a Camera." A. J. M. Fletcher.
Motherwell Y.M.C.A. C.C. "Portraiture and Gevaluxe Papers." J. R. Brinkley.
Newport C.C. Exhibition: "Photograms of the Year."
Oldham Equitable P.S. Committee Meeting.
Oldham P.S. "Sermons in Stone." E. S. Maples.
Padiham and D.P.S. Dorothy Wilding Portfolio (Portraiture).
Perivale and D.P.S. "Making a Good Negative." Rev. A. Mellors.
Rochdale P.S. "Some Lakeland Rambles." Miss A. Jackson.
Runcorn C.C. "Western Wirral." T. J. Smith.
Singer C.C. "Enlarging." J. Wrigley.
Smethwick and D.P.S. Inter-Club Competition with Handsworth P.S.
Sunderland P.A. "Child Photography." G. H. M. Graham.
Wakefield and D.C.C. "Combination Printing by the Cut Out Method."
Watford C.C. "Border Printing, Plate Sinking and Masking Devices."
Welfare C.C. "How to do your Developing and Printing."
Wimbledon C.C. "Sussex by the Sea." G. E. W. Herbert.
Woolwich P.S. Lecturettes. The Bromley Quartette.

Friday, November 19th.

Royal Photographic Soc. Exhibition of Kinematography.
Bethnal Green C.C. Lantern. Alliance Comp. Slides, 1936.
Castleford Y.M.C.A. P.S. "Impressions of France." Messrs. Easedale and Hadfield.
Dartmouth L. and D.S.P.S. "Enlarging." G. E. Broome.
Galashiels C.C. S.P.F. Lantern Slides, Monochrome.
Harrogate P.S. "Spiders." Dr. W. O. Greenwood.
Howard de Walden P.C. Lantern Lecture on Skye. W. Mitchell.
King's Heath and D.P.S. "The Western Fjords of Norway." W. Pedley.
Leigh Lit. Soc. (Phot. Sec.) Practical Night.
Leytonstone and Wanstead C.C. "Fitting up a Dark-room." J. Ainger Hall.
Newport (Mon.) C.C. Exhibition—"Photograms of the Year."
Photomicrographic Soc. Members' Evening.
Scarborough P.S. "Cine Films in Colour." J. Streeter Ellis.
Sheffield and Hallamshire P.S. Social Whist Drive.
Southend-on-Sea and D.P.S. Carbo. J. Cole.
Windlesham C.C. "Making and Improving Cameras and Apparatus."

Saturday, November 20th.

Royal Photographic Soc. Exhibition of Kinematography.
Ashton-under-Lyne P.S. Beginning of 15th Annual Exhibition.
Hampshire House P.S. Criticism of Members' Monthly Competition. N. Griggs.
Hornchurch Evening Inst. P.S. Beginning of Annual Exhibition.
Newport (Mon.) C.C. Exhibition—"Photograms of the Year."
Northamptonshire N.H.S. and F.C. Autumn Ramble. Gayton to Bugbrooke.
Tadmorden P.S. Prize Competition.

Monday, November 22nd.

Ashington and Hirst C.C. "Composition." R. G. Webster.
Bexley Heath P.S. "Improving the Negative." R. H. Lawton.
Bournemouth C.C. Social Evening and Debate.
Blackburn and D.C.C. "Chloro-bromide Printing." H. Chapman.
Blackpool and Fylde P.S. Visit to the Photographic Works of Messrs. Dowty, Ltd.
Bradford P.S. "Ten Great English Cathedrals." Travis Burton.
City of L. and Cripplegate P.S. First Print Competition.
Darlington C.C. "Alpine Photography." J. E. Christopher.
Edinburgh P.S. Last day for Receiving Prints for Members' Exhibition.
Erdington and D.P.S. Alliance Competition Slides, 1937.
G.E.C. (Witton) P.S. "Cycle Tour to Devon and Cornwall." N. R. Trout.
Glasgow and W. of Scotland P.A. Finishing and Touching-up Exhibition Prints.
Gravesend and D.P.S. Social. Lecturette Evening. My Method.
Hanley P.S. Developing and Printing.
Hornchurch Evening Inst. P.S. Lantern Show. "Travel Talks."
Howard de Walden P.C. Entries for "Daily Record" Competition.
Ipswich and D.P.S. Lantern Lecture. J. C. Carter.
Kidderminster and D.P.S. "Gevaluxe." C. R. Hughes.
Kingston C.C. Competition and Lecturette Evening.
Lancaster P.S. Home Portraiture Competition.
Leeds C.C. "Genre and Figure Studies." T. Lee Syme.
Leek P.S. "Some Things seen in Holland."
Newcastle (Staffs) and D.C.C. Monthly Competition—Prints.
Oldham Equitable P.S. L. & C.P. Union Portfolio.

Monday, November 22nd—(contd.).

Orford P.S. The Dartmoor Country (Devon). H. Browning Button.
Shropshire P.S. Lantern-Slide Making. W. A. Lynch.
Southampton C.C. "Modern Aids to Indoor Portraiture."
South London P.S. "The Treatment of Negatives." H. A. Hayes.
Southport P.S. Small Print Competition Night.
Walsall P.S. Inter-Club Competition. Wolverhampton visit Walsall.
Walthamstow and D.P.S. "Shanks in Essex." E. J. Mason.
Weymouth and D.P.S. "The Etchadine Retouching Process." G. H. Potts, Ltd.
Wolverhampton P.S. Visit to Walsall Society.

Tuesday, November 23rd.

Ayr P.S. "Holidays with the Camera." Dan McDonald.
Bath P.S. "Inn Signs and their Origin." Gerald Grey.
Beckenham P.S. "In Kent with a Camera." A. E. Marden.
Bedford C.C. E.A.F. Portfolios and Slides.
Belfast C.P.A. C.C. Lantern-Slide Making by two Club Members.
Birmingham P.S. Photographic Alliance Competition Slides, 1937.

York P.S. "The Control of Image Tones on Kodak Papers." B. L. Twinn.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

FILM SPOOL SUGGESTIONS.

SIR,—May I, through your columns, be permitted to state a grievance against the manufacturers? I possess a well-known make of German camera taking 12 exposures on $3\frac{1}{2} \times 2\frac{1}{4}$ film, and find that while Agfa films (and presumably other Continental makes) fit my camera perfectly, Kodak are too tight, and I have to sandpaper the ends down to make the spool fit. Selo films are even worse, and in both cases the diameter of the metal ends are appreciably larger than the Continental makes. As Agfa films appear to fit all cameras on the British market, there seems nothing to lose and everything to gain by conforming to this size. If this is done I would suggest superseding the wooden spool by a metal one similar to that used for Selochrome film, as I have found that dust from the wooden core is responsible for much spotting.—Yours, etc.,

"PRACTICAL."

MERCURY HYPERSENSITISING.

SIR,—I have recently been using the process of hypersensitisation with mercury with success on Agfa I.S.S. film. I enclose three of these negatives. The two exteriors were given $1/200$ th sec. at $f/32$ in bright conditions without enough sun to cause marked shadows. The interior was given $1/10$ th sec. at $f/4.5$ in a room fitted with translucent green windows and which had rather poor lighting. Three days after exposure this film was exposed for 48 hours to the vapour of 100 grs. of mercury in a light-proof box. It was then developed at once for 4 minutes at 65° Fahr. in "Tabloid" M.Q., normal strength.

I estimate that the exposures given were at least eight times less than the normals for the subjects, but none of the negatives is grossly under-exposed (although the interior comes very near it). It should be possible to make reasonable prints of all three, and really good ones of the two exteriors. The grain is fairly fine, becoming just visible in a print of $3\frac{1}{2}$ -diameter enlargement on smooth paper. It can then only be seen by very careful scrutiny.—Yours, etc.,

G. A. JONES.

AN ADVERTISER'S GRIEVANCE.

SIR,—Do you think anything can be done to stop a certain form of annoyance that is pretty rampant?

I refer to the class of person too mean to buy a new camera and take a chance on it. They deposit cheques which may or may not be worth their face value, get amateurs' instruments, play about with them during a long week-end, and then discover "faults" which are either non-existent or utterly inconsequential, and, having had their bit of fun, send the outfit back. It seems a perfectly good way of messing about with other people's property that costs next to nothing.

I recently advertised a Zeiss Super Ikonta which, with my hand on my heart, I can say was absolutely as new. It was about two and a half months old and had been used about five times. If ever a camera was perfect that one was. I

say "was," for it is not so now. The enquirer made so many excuses before risking his cheque that I felt it was bound to come back, having met the type before; but this kind of thing is getting very common.

The gentleman who has "honoured" me with his wretched deposit will get a letter from me that will rather spoil his breakfast—the silly ass says he cannot keep the camera because *it has not got a handle!* He overlooks the fact that this particular instrument has a neck sling, and is intended to be used with such.

I repeat, is there any way of checking the activities of such people as this?—Yours, etc.,

D. H. ROBERTS.

PERFORMANCE OF CHEAP CAMERAS.

SIR,—On reading through the issue of "The A.P." dated October 13th, I find that Mr. Dickinson states the highest grade twin-lens reflex cameras are not instruments of precision with regard to the film lying flat in the camera, and that a friend of his had made some tests and found that they would not permit five times enlarging at $f/3.5$.

May I suggest that the camera in question was either damaged or else something went wrong with the tests. If what he says is true, why do so many advanced workers, amateur and professional, use the high-grade twin-lens reflex cameras? Surely not because they are not instruments of precision? As for enlargements, I would advise him to pay a visit to R. F. Hunter Ltd., where there is a large selection of 3×3 ft. enlargements from 4×4 cm. and 6×6 cm. negatives, and there is not much wrong with them.—Yours, etc.,

M. ALLINSON.

(Switzerland.)

FOCAL LENGTH AND EXPOSURE.

SIR,—Your correspondent Mr. C. P. Vaughan seems to have made a very serious miscalculation if he gets *over-exposure* when giving $f/64$ sixteen times the exposure for $f/8$, as the correct exposure for $f/64$ is sixty-four times the correct exposure for $f/8$!—Yours, etc.,

J. L. REES.

PLATES AND FILMS.

SIR,—In your issue of the 20th October, Mr. R. E. Dickinson describes an experiment from which he concludes that there is no inherent difference in definition between plates and films, provided they lie in a perfectly flat plane.

It seems that this experiment does not clear up the point raised by Mr. Zimmermann who says "the difference, which is very slight, seems to be in the very nature of the film support itself." In Mr. Dickinson's experiment he deliberately sandwiches his piece of film between two glass plates under pressure; and thus does not allow any tendency of the film support itself to curl, as it might do when in a normal roll-film camera. A fairer test would be to use two exactly similar cameras, one having a normal plate back, and one with a roll-film back, to photograph the same object under similar conditions of lighting and exposure, and to compare the results on the negatives. The whole question is one of film support—not emulsion.—Yours, etc.,

W. R. COCKS.

COLOUR TRANSPARENCIES AND COLOUR PRINTS

READERS who are not fully acquainted with modern colour processes and their possibilities will find an extremely complete and comprehensive series of articles on the subject in Parts 7 and 8 of the "Modern Encyclopedia of Photography."

After an introductory article by Dr. D. A. Spencer, the President of the Royal Photographic Society, in which the basic principles of photography in colour are lucidly presented, there follows a series of articles in each of which an expert describes, in practical as well as theoretical detail, the particular process in which he specialises.

The articles cover the Autochrome,

Filmcolor, Dufay and Finlay additive processes, and the Kodachrome, Agfa-color and Gasparcolor subtractive processes, all of which provide transparencies on glass or celluloid. There is a general article on the methods used to obtain colour prints on paper, and the Trichrome Carbro and Duxochrome pigment processes, the Vivex subtractive process, the Jos Pé and Eastman Wash-off Relief imbibition processes, and the Chromatone and Photocolor Bi-Chrome toning processes are each in turn the subject of a separate article.

We do not know of any other source of information about the various methods used for colour photography that even

approaches the completeness of this series, and we strongly recommend all readers who are interested in the subject to make sure that they obtain copies of these two parts. Part 7 of the "Modern Encyclopedia of Photography" was published on November 9th, and Part 8 was published yesterday. They can be obtained from any bookseller or bookstall at 1s. each. We have already referred to this excellent Encyclopedia, which will be completed in about thirty weekly parts. Our readers should secure copies of the first seven parts which are still obtainable. The publishers are The Amalgamated Press Ltd., The Fleetway House, Farringdon Street, E.C.4.

November 17th, 1937

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Amateur photographers and movie-makers, particularly those interested in colour work, will be glad to hear of the latest addition to the range of Kodak Night Photography Aids. This is a special high-power "Photoflood" lamp, known as "Photoflood" Type N. It consumes 500 watts, compared with the 275 watts of the regular "Photoflood." The respective lamp lumens are 17,000 and 9,000. The new "Photoflood" also has a considerably longer life—about six hours' continuous burning time. Owing to its higher current consumption the "Photoflood" Type N is recommended for use on power circuits. It is fitted with a screw cap, so that it cannot be plugged into ordinary electric light sockets; this guards against its use on unsuitable circuits with the consequent inconvenience of "blown" fuses. The lamp can be used in conjunction with the "Kodalite" portable lighting outfit, which is made to accommodate the screw-cap type fitting, and has a reflector of special surface and shape. When the "Photoflood" lamp is screwed in, the filament comes exactly in the right position in relation to the reflector to produce a broad, perfectly even beam of intense but diffused parallel light, which enables a large field to be adequately illuminated. The "Photoflood" Lamp, Type N, is available in all standard voltages price 6s. The "Kodalite" Reflector, consisting of folding adjustable stand, special reflector and connecting flex, costs £4 10s., double unit, £6.

A new postal club, known as the Half-plate Postal Club, has just been formed under the secretaryship of Mr. George A. Slight, 18, Ewelme Road, Forest Hill, S.E.23. The object of the group is to cater for the many amateurs who normally make "trial" enlargements up to half-plate size, which, without being too costly, are large enough to give a full appreciation of the delicate tones and pictorial merits of a picture. Besides prints, features of the new club will be the usual notebooks, lecturettes, and "One-man Shows," etc. It is also intended that the group shall seek membership of the Central Association of the Royal Photographic Society.

Messrs. Ensign, Ltd. have just published their winter catalogue for amateur cinematographers. Besides brief descriptions of Ensign cameras and projectors, this list contains details of a very comprehensive range of ciné accessories of all kinds. A separate catalogue contains titles of the very large number of films available for hire from the Ensign film library. Interested readers should note that there has been a substantial reduction in the charge made for week-end hire. These catalogues can be obtained on application to Messrs. Ensign, Ltd., at 88-89, High Holborn, W.C.1.

A few amateur enthusiasts in the Uxbridge district are endeavouring to form a club, to be known as The Uxbridge and District Camera Club, but find a difficulty in getting in touch with other photographers. Any amateur photographers living in the district who are interested should write to Mr. J. Quint, 11, Glebe Road, Uxbridge, Middlesex, who will be pleased to send particulars of the club's meetings and future plans.

The Super Baldina 35-mm. miniature camera, which was fully reviewed on page 304 of our issue of September 15th, is now available in a new model in which all metal parts are chromium-plated. But the main improvement is that the release of the Compur shutter is now moved to the body of the camera, making the instrument even more convenient to handle than the earlier model, in which the original trigger release was retained. This very complete little range-finder miniature is priced at £14 10s. with 5-cm. f/2.9 Trioplan anastigmat in Compur shutter, and can be had with an f/2.8 Tessar or an f/2 Xenon at prices of £19 15s. and £21 5s. respectively. The new Super Baldina can be obtained through any dealer, and full particulars of it may be had from the Norse Trading Co. (London) Ltd., of 37, Rathbone Street, London, W.1.

A 16-mm. talkie film, entitled "In the Land of the Red Blanket," has recently been stolen from the stationary car of one of our readers who lives in Plaistow. If any who read this can assist in tracing the stolen film will they please communicate with Mr. F. George, 30, Credon Road, Plaistow, E.13.

A short time ago some skilled and enthusiastic amateurs in Japan organised a society called the Camera Pictorialists of Japan, of which the Editor of the "Camera," Mr. Katsuo Takakuwa, 1984, Kichijoji, Near Tokyo, Japan, was elected the Honorary Secretary. The principal object of the society at the present time is to send members' work to the international photographic salons abroad, although in time they hope to be in a position to conduct an international salon of their own. In order that the members of this society may have time in which to prepare their exhibits will secretaries of various international exhibitions please note the above address and let the Hon. Secretary have a batch of entry forms in good time, in order that he may distribute them amongst the members.

The title of this week's prize-winning picture in the Wallace Heaton "Ships and the Sea" competition is "In the Breeze," and is by Mr. F. J. Taylor, 11, First Avenue, Blyth, Northumberland. Full particulars of these weekly competitions for readers of "The A.P." will be found regularly in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue.

The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ x 3½ x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

100. Makers' Formulæ: Developers for Kosmos Papers—(1)

M.Q. for Bromide Paper.

Potass. metabisulphite	22 grs.	(2.5 grm.)
Metol	13 grs.	(1.5 grm.)
Hydroquinone	60 grs.	(7 grm.)
Sodium sulphite (anhydrous)	220 grs.	(25 grm.)
Sodium carbonate (anhydrous)	290 grs.	(33 grm.)
Potassium bromide	4½ grs.	(0.5 grm.)
Water to	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 800 grs. (100 grm.).

This developer is used undiluted.

Amidol for Bromide Paper.

Sodium sulphite (anhydrous)	220 grs.	(25 grm.)
Amidol	55 grs.	(6 grm.)
Potassium bromide	9 grs.	(1 grm.)
Water to	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.).

This developer, which gives a rich black, is used undiluted.

Novex M.Q.

Metol	20 grs.	(2.3 grm.)
Sodium sulphite (anhydrous)	220 grs.	(25 grm.)
Hydroquinone	50 grs.	(6 grm.)
Sodium carbonate (anhydrous)	325 grs.	(37 grm.)
Potassium bromide	2½ grs.	(0.3 grm.)
Water to	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 880 grs. (100 grm.).

This developer should be used, undiluted, at a temperature not below 60° Fahr. Novex paper should be developed for 40 to 50 secs.

This developer is available in packet form.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

"Zone" Focussing.

Please let me know what is meant by "zone" focussing. Is the system reliable for sharp pictures at all distances?

T. M. T. (Cardiganshire.)

"Zone" focussing is an application of the well-known principle of depth of focus. Cameras graduated for "zone" focussing are so arranged that, instead of focussing on, say, 20 ft., you may focus on the range 12 ft. to infinity. Except for the method of graduating the scale there is no difference between "zone" focussing and any other kind.

Safe for Panchromatic Film.

I would like to use panchromatic film in my camera; would a green slide over the red window be adequate protection? J. H. P. (Redcar.)

For making a red window safe for panchromatic film, it should either be covered over with one of the flaps supplied with some makes of film, or should be surrounded on the inside of the camera with a velvet pad which is in contact with the backing-paper as the film runs through the camera.

Stops and Shutter Speeds.

I have recently bought a reflex camera with stops from $f/3.5$ to $f/22$ and shutter speeds from $1/15$ th to $1/1,000$ th sec. As I am a complete novice in photography, could you tell me the correct shutter speed to use with each of the various stops on the lens? E. H. E. (St. Helens.)

No one shutter speed is earmarked as belonging to any particular stop; for different subjects and lighting all sorts of different combinations are required. We strongly recommend you to obtain an elementary book on photography; you would find "Brighter Photography," published by Iliffe & Sons Ltd. at 2s. 6d., very informative. The Ilford Manual of Photography (2s.) is a little more advanced, and you will find the Wellcome Diary, which contains an exposure calculator, very helpful in matters of exposure. Any of these books can be obtained from Messrs. Sands Hunter, Ltd., 37, Bedford Street, Strand, W.C.2.

Supplementary Lenses.

Could you advise about the use of a simple supplementary telephoto lens? How do I fit it, how much increase of image-size will there be, and will the definition and f /number of my lens be altered? F. V. S. (Newcastle.)

The type of "telephoto" supplementary lens to which you refer lengthens the focal length of the lens to which it is added, and so enables it to give larger images. As these supplementaries are often uncorrected, they may to some extent degrade the definition, though a moderate stopping down will usually overcome this. The f /numbers marked on the scale are no longer correct; they are increased in the same proportion as the focal length.

A point of the greatest importance is that supplementary lenses of this type cannot be used at all on the modern fixed-extension camera; when the focal length of the lens is increased to give the larger image it has to be considerably farther from the plate or film than its normal distance. A camera with long extension is an absolute necessity, and a focussing screen must be used to see when the image is sharp. In practice, this generally means that supplementary lenses of the variety you mention can only be used with a plate camera.

Stock Solutions.

I use a Kodak film tank and wish to make up my own developer. The formula is: sodium sulphite, 30 grs.; sodium carbonate, 20 grs.; pyro, 10 grs. I intend to make a stock solution of the first two, and another of the pyro; can you tell me how best to make up the pyro solution so that it will keep? B. T. S. (Derby.)

Your best way of making up a stock pyro solution is to dissolve 100 grs. of potassium metabisulphite in about 6 oz. of water; then dissolve 1 oz. of pyro and make up to 9 oz. 1 drachm. This will be a ten per cent solution; 100 minims of it will contain the 10 grains of pyro that you require. The preservative does not appreciably affect the development time.

Film Speeds and Meters.

With Agfa I.S.S. film I had intended to set my newly-bought photo-electric meter at 29° Scheiner, but I have read that the correct figure to use is much less than this—about 23° Scheiner. Can you tell me which is right? H. P. S. (Scarborough.)

The different Scheiner readings of films for different exposure meters is mostly due to different opinions on the part of the meter designers as to what constitutes a sufficiently-exposed negative. If we were in your position we should expose our first film on the assumption that the lower speed number was correct, and if, on development, the negatives appeared to have had unnecessarily generous exposure, we should raise the speed number when next using the meter.

Photographic Society.

Would you be good enough to send me the address of any photographic societies there may be within easy reach of this address?

W. E. B. H. (Putney.)

Your nearest photographic society appears to be the Wimbledon Camera Club, the Secretary of which is Mr. H. R. Meier, of 10, Woodlands, Raynes Park, S.W.20.

Next is the Chelsea Photographic Society—Secretary, Mr. F. A. Perkins, 73, Montholme Road, S.W.11.

There is also the Kingston Camera Club—Secretary, Mr. V. W. Banks, 1, Cadogan Road, Surbiton; and the Richmond Camera Club—Secretary, Mr. F. H. Howard, Dalkeith, Couchmore Avenue, Esher.

The secretaries will be pleased to furnish you with full particulars, and we trust that from the above-mentioned societies you will be able to find one that meets your requirements.

Wynne Meter Scales.

I have a Wynne's exposure meter, with plate-speeds marked after some special system in f /numbers. Can you explain the system, and tell me how it compares with H. & D. or Scheiner speeds? C. G. R. (Swindon.)

For the practical use of your Wynne meter your best plan will be to obtain from the makers a speed list of all the modern plates and film. We think you could obtain this by sending 3d. to The Infallible Exposure Meter Co., of Wrexham. The basis of the system of marking is that at a lens-aperture numerically equal to the f /number allotted to the plate, the exposure required is the same as the time taken by the paper to darken. H. & D. speeds are therefore proportional to the square of the Wynne speeds, and a plate rated at F164 Wynne is about 450 H. & D. or 23° Scheiner.

Blackening Aluminium Fittings.

Is there any process by which I can blacken the aluminium fittings of my camera?

W. J. S. (London.)

The following process can be used for blackening aluminium:—

Prepare the following mixture.

Hydrochloric acid..	1½ oz.
Iron sulphate ..	60 grs.
White arsenic (i.e. arsenious anhydride, or arsenious oxide) ..	60 grs.
Water ..	1½ oz.

The aluminium is first thoroughly cleaned with fine emery cloth, and then dipped in the above "arsenic bronze" bath.

CITY "FILMO" FANS

We have a large Stock of new "Filmo" Cameras, Projectors and accessories, and offer expert attention and advice, with efficient "Service after Sales." Generous exchange allowance. Approval or Hire Purchase arranged.

16-mm. Bell & Howell **FILMO "70DA"**; turret head; critical focuser; hand crank; universal finder; seven speeds; type "B" case.... **£76 15 0**

AT LAST!

The "NOVOREX" is here

THE NEW ALL-BRITISH PRECISION ENLARGER

AT A COMPETITIVE PRICE!

SOME TIME ago we conceived the idea that a BRITISH-MADE precision enlarger would appeal to all amateurs, and the result of our numerous experiments is the "NOVOREX." While adhering to proved principles it also embodies the collective ideas of many of our valued customers, and, though simple in design, its attractive appearance and perfect performance will satisfy the most fastidious.

Obtainable only from the Manufacturers:

TURNER'S

CAMERA EXCHANGE

Newcastle-on-Tyne

Phone: 22655.

9, PINK LANE.

Specification :

- 1.—Solid construction with 36-in. chromium-plated steel upright and 18 x 24 in. baseboard. Large, well-ventilated lamphouse with crystal enamel finish.
- 2.—Illumination, 60 or 100 watt opal lamp, easily removed double condenser, 6-ft. flex with universal plug and switch.
- 3.—Fitted with special Aldis f/4.5 anastigmatic lens with iris diaphragm.
- 4.—Very fine focussing by means of helical screw mount.
- 5.—Metal negative carrier with two glass plates and clamping device for using uncut films.
- 6.—Orange cap on swing mount.
- 7.—Enlargements from 1½ to 7 diameters on baseboard, and by swinging the lamphouse unlimited size can be obtained.
- 8.—Prices : For negatives up to 6 x 6 cm., without lens..... **£8 0 0**
Ditto, with f/4.5 Aldis anastigmat..... **£10 10 0**
For negatives up to 3½ x 2½, without lens **£9 5 0**
Ditto, with f/4.5 Aldis anastigmat..... **£11 15 0**
4½-ft. upright **7s. 6d. extra.**
Adjustable masking frame, 12 x 10 in., **27s. 6d.**
" " " 10 x 8 in., **22s. 6d.**

USE Johnson's FLASHPOWDER FOR INSTANTANEOUS INDOOR PHOTOGRAPHY

NO SPECIAL APPARATUS NECESSARY.
NO PREVIOUS EXPERIENCE REQUIRED.

NOW READY.—A new book which will help
you to get the best results with your camera!

Brighter Photography

by DAVID CHARLES, F.R.P.S.

This handy book reveals in a clear, attractive way the secrets of successful photography. Though primarily intended for the novice, it is invaluable to every keen camera user.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint. By simple cross references these illustrations provide a series of clear, concise lessons in the art of making better pictures.

ILIFFE & SONS LTD., DORSET HOUSE, STAMFORD STREET, LONDON, S.E.1

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26b, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

CAMERAS AND LENSES

LEICAS, Contaxes, Rolleiflexes, etc., in case of failure to sell your miniature camera privately, ring Holborn 4780 for immediate cash price. [0045]

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE & SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

A PAILLARD- BOLEX projector for £29:17:6!

The New Model DA 37

projector for 9.5 and 16 mm. films has all the characteristics for which Paillard apparatus is famous—very steady projection—great screen brilliance—precision design eliminating possibility of damaged films—very efficient cooling both at lamphouse and gate, and absolute reliability.

In fact, both in performance and value the DA 37 is the home projector *par excellence*.

Ask your dealer for a demonstration.

- 400-watt projection lamp with double row of filaments gives brilliant pictures on screens up to 6 or 8 ft. wide.
- Shows both 9.5 and 16 mm. films. Price includes resistance and 400-watt lamp.
- Still pictures for any length of time, instantaneous reverse projection (shows motion backward), rapid motor rewind and many other refinements.
- Flickerless projection ensured by special shutter giving three obscurances per picture.

THE SERVICE COMPANY

For all Photographic and Ciné Apparatus, New and Second-hand. Exchange and Deferred Terms.

THE NEW PATHESCOPE "H"

This new outfit for real motion pictures in the home is for the projection of 30-ft., 60-ft., 200-ft. and 300-ft. reels. The "H" is solidly built and is for use on all alternating current mains from 200 to 250 volts, 40-60 cycles.

The "H" is motor-driven through a transformer in the base, sprocket fed and ensuring steady, correctly centred pictures with direct and brilliant screen illumination from a 100-watt lamp; there is also a semi-automatic shutter for film protection during threading **£10 10s.**

Or 18 equal payments of 12/6 per month.

THE DEKKO 9.5-mm.

Aluminium lamphouse, designed to dissipate heat. Lamp, 50-volt, 25-watt. Double the illumination of similar models, invaluable for dark and under-exposed films. New type of shutter between the lamp and film to eliminate burning and bucking of the film. The resistance is housed in this base, suitable for voltages from 110 to 250.

Hand-turn Model. £3:19:6
Or 9 equal payments of 9/5 per month.

With Motor. £5:17:6
Or 12 equal payments of 10/3 per month.

Extra for Super Attachment 15/-

— ENLARGERS —

All models, vertical and horizontal.

From £2 upwards

★ JUST OUT THE NEW PATHESCOPE 'H'

for Real Home Movies

This NEW outfit for real motion pictures in the home is for the projection of 30-ft., 60-ft., 200-ft. and 300-ft. reels. The "H" is solidly built and is for use on all alternating current mains from 200 to 250 volts, 40-60 cycles.

The "H" is motor driven through a transformer in the base. Sprocket fed and ensuring steady, correctly centred pictures with direct and brilliant screen illumination from a 100-watt lamp, there is also a semi-automatic shutter for film protection during threading.

The price is remarkably low. Only

£10:10

Or on our exclusive SELF-FINANCED Hire-Purchase Terms.

ALSO NEW PATHESCOPE 'S'

Non-commutator, synchronous motor, pictures 16 or 24 per sec. Sprocket feed. 200-watt lamp, transformer fed. Projects 800 ft. Motor rewind. All mains 110 to 250 volts. £30

VAUXHALL

COUPLED RANGE-FINDER MINICAMERA

FLIGHT

AIRCRAFT ENGINEER
AND AIRSHIPS

*The First
Aero Weekly
in the
World*

All the latest developments
in connection with aviation
are recorded in the pages
of "Flight."

Illustrated descriptions of
new aircraft, aero engines
and equipment, British and
Foreign, appear regularly,
as well as practical articles
giving the latest information
for Club members and
amateur pilots.

"Flight" is the leading
authority on aviation. It
contains Royal Air Force
news, and deals with the
work of R.A.F. Squadrons,
with Private Flying, and
with Commercial Aviation,
Airlines, and Airports.

A special staff of highly com-
petent aerial photographers
ensures that "Flight" con-
tains the finest photographs
of aviation in all its aspects.

WALL'S DICTIONARY of PHOTOGRAPHY

and Reference Book for the Amateur and Professional Photographer

Fourteenth Edition—Revised

Edited and largely re-written by
F. J. MORTIMER, Hon. F.R.P.S.

A complete reference work for the practical photographic worker. It provides useful information in dictionary form on every phase of photography—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulae, etc. All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on all recent developments.

The Complete 9.5 mm. Cinematograph

By HAROLD B. ABBOTT

Because of advances in film technique this book supersedes the author's former successful book "Motion Pictures." The beginner can take it up and find everything he needs to know in order to make successful pictures.

How to choose a 9.5-mm. ciné camera; how to expose correctly; what to take and how to take it; full instructions on developing and printing; methods of planning, of editing, titling and trick effects; the art of projection; methods of operation, screen and picture sizes; giving an efficient show; all these are explained in detail.

There are nearly 100 illustrations. The book, packed with useful information, is a comprehensive course of instruction in amateur cinematography.

DOLLOND & AITCHISON LTD. ESTD. 1750

FLASHING REDUCTIONS TO CLEAR OUR STOCK!

We are loaded with Second-hand Cameras. 1937 has seen such big business in new goods that we have not had time to bother with the cameras taken in part exchange. They are everywhere. Our shelves are blocked, our cupboards are full. They are all fine items, all the junk is thrown away. Get one while the buying is good. Compare prices with similar items offered elsewhere. You will find ours are half the price and less. You know our reputation for service, quality and value. Enough said! Five days' approval against full cash deposit allowed to post-buyers. Send cash with your order now.

ILFORD

**HYPERSENSITIVE
PANCHROMATIC PLATES**

Haven't you noticed how everyday scenes and subjects take on a different, fascinating aspect after dark? Those lamp-light reflections on rain-glistening roads—the noble façades of floodlit buildings—if only you could capture them with *your* camera... You can to-night—thanks to Selo Hypersensitive Panchromatic Roll Film and Ilford Hypersensitive Panchromatic Plates. Such is their remarkable speed that almost every street or square presents its opportunity for a perfect picture. Indoors, too, you can make charming studies of home life and really natural portraits. It's all so simple and so original.

Made in England by
ILFORD LIMITED, ILFORD, LONDON

Simple and Fascinating

Enlarging with an

Ensign

MAGNAPRINT

For full details of British-Made MAGNAPRINT Enlargers ask your dealer for a copy of "On the Art of Enlarging by Ensign," or write to ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

Watch this space each week

BRIGHT LIGHTS for WINTER NIGHTS—

Invest in these simple, inexpensive Kodak Indoor Lighting Aids and give your camera the run of the house!

“Photoflood” Lamp. Plugs into the ordinary electric light sockets. Consumes only 275 watts, yet gives out brilliant light photographically equivalent to that provided by a normal 750-watt lamp.

All standard voltages, **2/6.**

“Kodaflector” Reflector. Increases efficiency of “Photoflood” Lamp many times. Clips round electric light socket; also supplied complete

with own stand and length of flex so that the “Photoflood” can be moved about and placed in most advantageous position.

“Kodaflector” only, **3/-.**

“Kodaflector,” Stand, Flex and Plug, **7/6.**

Special for Colour ‘Fans’!

The following lighting combination gives just the broad, even flood of illumination needed for well-exposed, sparkling colour pictures on “Kodachrome” Type A Film, “still” or movie.

High-Power “Photoflood” Lamp Type N, extra-brilliant lamp (screw-fitting) giving 6 hours’ continuous light, **6/-.** For use in conjunction with the **“Kodalite” Reflector,** a strongly made portable lighting unit with specially designed reflector that gives powerful beam of maximum intensity. Complete with folding adjustable Stand, **£4. 10. 0.**

The Film to use

KODAK SUPER SENSITIVE PANCHROMATIC

Anti-halo backed, lightning speed, specially sensitive to artificial light. Roll, Pack, 35 mm.

KODAK SUPER X

For “Retina,” Leica, etc. Fastest film of all. Phenomenal sensitivity, fine grain. 35 mm.

Ask your dealer for Kodak Night Photography Booklet or write to Mr. A. P. Taylor, Dept. 57B,

KODAK LIMITED, KODAK HOUSE, KINGSWAY, LONDON, W.C.2

"SPEED & ACTION" PICTURES

PHOTOGRAPHIC COMPETITION

Racing, hunting, hockey, football, car-racing—these are the ordinary subjects for speed and action pictures, but there are others—for instance you can snap a cup breaking to smithereens at the moment of its impact with the kitchen floor, or you may take a picture of a golf ball the moment it comes in contact with the club. There are numerous good opportunities for Speed and Action pictures—grasp them and send in your entries.

Any amateur may enter, using any camera or materials.

NO ENTRANCE FEE AND THE RULES ARE SIMPLE

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA or MATERIALS, DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE MOUNTED OR UNMOUNTED (not less than 8 x 6 unmounted is recommended).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPY-RIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd. without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped address envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry.

A selection of the best entries will be held back at the close of the competition for exhibiting in our galleries prior to their return.

Last week's prize-winner: Sidney Phillipson, 57, Redcliffe Rd., London, S.W.10, with picture entitled "Oriental," in "Indoor Figure Studies" Competition.

No Deposit To Pay For Your

The first few shillings instalment secures any purchase costing 50/- or more. Should you choose anything costing £10 or over—we give you two years to pay for it. This is the REALLY EASY way to buy, and we assure you that every deal is strictly confidential. Write and tell us your needs.

9.5-mm. PATHÉSCOPE "H"

Takes 60-ft., 200-ft. and 300-ft. reels. The "H" is solidly built and is for use on all A.C. mains from 200 to 250 volts, 40-60 cycles. Motor-driven through a transformer in the base, sprocket fed and ensuring steady, correctly centred pictures. 100-watt lamp, semi-automatic shutter for film protection.

Cash price **£10:10:0**
24 monthly payments of 9/5.

LEICA IIIa

Chromium model. Speeded to 1/1,000th sec., f/2 Summar lens, in collapsible mount. 36 exposures at a loading.

Cash price **£43:0:0**

24 monthly payments of 38/7.

KODAK 6-20 "DUO" (CHROMIUM)

Takes 16 pictures on 3 1/2 x 2 1/2 roll film. With Compur shutter, Zeiss Tessar f/3.5 lens.

Cash price **£13:10:0**

24 monthly payments of 12/2.

BLENDUX Exposure Meter

The lens incorporated in the "Blendux" makes it the finest photo-electric meter on the market at such a low price. With ever-ready case.

Cash price **67s. 6d.**

KINE-EXAKTA

Built-in ground-glass screen. Focal-plane self-capping shutter. 12 secs. and 1/1,000th sec., and 6 secs. and 1/1,000th sec. with delayed action. f/2.8 Zeiss Tessar lens.

Cash price **£38:10:0**

24 monthly payments of 34/7.

"KODASCOPE" 50.R 8-mm.

The extra-powerful 200-watt lamp gives brilliant picture measuring 30 x 22 in., 14 1/2 ft. from the screen, or 40 x 30 in. at 19 ft. Can be used on any circuit by means of small interchangeable plug-in resistances. Fast motor-driven rewind, large cooling fan and sturdy construction are among its features. Price, including 1-in. lens and accessories **£13:13:0**

24 monthly payments of 12/3.

BRAND NEW SPECIAL OFFER!

The Entire Remaining Stock of Messrs. Ilford's

PHOTOFLOODS & REFLECTORS

Just the thing for indoor photography. A well-made article including Photoflood lamp of any voltage, and reflector on adjustable table stand.

New 'MOVEX' 8-mm. Ciné Camera

An AGFA Production.

Flat in shape, notably compact, light in weight, the New "MOVEX" Ciné Camera scores powerfully in convenience of handling and ease in manipulation. With body of strong aluminium alloy, with black matt finish and bright parts chromium plated; it is both handsome and durable. Takes 33 ft. of film in easy daylight-loading cassettes—no threading is needed. Fitted with $f/2.8$ Agfa Kine anastigmat, with integral adjustable hood, Newton finder, always ready for use. Exposure guide incorporated on cover of camera.

Price £12 : 12 : 0

12 monthly payments of 22/1,
24 of 11/1.

Ever-ready Case, 18/-.

NEW KODASCOPE 8-mm. Projector

(Model 50R). This new model embodies all the attractive features of the highly popular model 35, together with many detail improvements—especially in electrical equipment, resulting in greatly improved all-round performance. 200-watt lamp gives brilliant picture 30×22 in. at 14½ ft., 1-in. projection lens; motor drive with large cooling fan.

£13 : 13 : 0

12 monthly payments of 23/11,
24 of 12/-.

New ROLLEIFLEX

In this new model the 6×6 cm. ROLLEIFLEX for 12 pictures on usual 3½×2½ spool becomes more than ever automatic, revealing a still higher standard of optical and mechanical perfection. Only one action is now needed to:—

- (1) set the shutter;
- (2) safeguard against either blank or double exposures;
- (3) to give delayed action.

There are also amongst other improvements new controls for shutter speeds and lens apertures, with magnified readings. The reflex hood is fitted with larger magnifier, and there is a double magnifier and additional mirror for eye-level use. Lens is $f/3.5$ Tessar, with Compur Rapid shutter, speeded to 1/500th sec.

Price £31 : 5 : 0

12 monthly payments of 54/8, 24 of 27/4.

ZEISS IKON IKONTA SQUARE MODEL

12 pictures 2½ in. square on usual 8-exposure 3½×2½ spool. 100 per cent self-erecting, shutter release on camera body.

F/4.5 Novar, in delayed-action Telma shutter, 1/25th to 1/125th sec., T. and B. **£6:12:6**

12 monthly payments of 11/7.

F/4.5 Novar, in delayed-action Klio shutter, 1 to 1/175th sec., T. and B. **£7:5:0**

12 monthly payments of 12/8.

F/3.5 Novar, in Compur shutter, 1 to 1/300th sec., T. & B. **£9:10:0**

12 monthly payments of 16/8.

F/3.5 Tessar, in Compur Rapid, 1 to 1/500th sec., T. and B. **£13:0:0**

12 monthly payments of 22/9, 24 of 11/5.

RAJAH ENLARGERS

of Precision Design and Construction.

F/4.5 anastigmat, one-hand lever rise and fall with automatic locking. Large, well-ventilated lamp-house. Universal negative carrier for either strip or single negatives. Helical micro. focussing, orange cap. Metal work finished in attractive grey lacquer.

Model O, 4×4 cm., enlarges 2 to 8 times linear, complete with condenser **£8:8:0**

12 monthly payments of 14/8.

Model IIb, 6×6 cm., 2 to 7 times linear, double condenser **£11:10:0**

12 monthly payments of 20/2, 24 of 10/1.

Also for 6½×9 cm.

ROBOT The Camera that does everything for you.

With $f/3.5$ lenses from £23 10 0

An entirely new and original camera of novel design and ultra-modern features. More completely automatic than any camera yet devised. Takes 48 square pictures on usual 35-mm. cine film, with daylight loading and removal of whole or part of film, film winding and shutter release simultaneously, and permitting automatically up to 24 exposures in rapid succession, with one movement only, if desired. Special "zonal" focussing system taking place of range-finder. Shutter closely graduated 1 to 1/500th sec. With $f/2.8$ Tessar **£29:10:0**

12 monthly payments of 51/8, 24 of 25/10.

Interchangeable Schneider Tele-Xenar $f/3.5$ **£10:0:0**

Stocks quite remarkable in their scope and variety—meeting every need in photography, both 'Ciné' and 'Still' and the easiest, simplest and fairest Out-of-Income plan. Ask for full details.

Here is a Particularly Fine Enlarger. The 'MULTIFAX'

Full of attractive practical features. For instance: Exceptionally smooth raising and lowering by friction gear, with triangulated main column, giving maximum rigidity. Usable either vertically or horizontally at will. Readily adaptable for dealing with enlargements of extra size.

F/4.5 lens and DOUBLE condenser are both interchangeable, and there is simple provision for correction of perspective. Adjustable lamp-holder ensures highest degree of even illumination, whilst the unique automatic action of the strip negative carrier sets a new standard in simplicity and efficiency. Adaptable for all sizes 24×36 mm. to 6×6 cm.

PRICES :

3½×2½ **£16:16:0**

12 monthly payments of 29/5, 24 of 14/9.

R. G. LEWIS (CINÉ), "THE ONLY COMPLETE CINÉ SPECIALISTS"
202, HIGH HOLBORN, LONDON, W.C.1

(A few doors from the Holborn Tube Station and the Holborn Restaurant)

Telephone: CHAncery 7596 7997.

Do you know what this is?

The illustration shows, on the left, the focussing wheel of the patent rotating wedge distance meter on the Super Ikonta $2\frac{1}{4}'' \times 2\frac{1}{4}''$. All the other controls—shutter setting lever, scale of shutter speeds, and scale of diaphragm apertures, are equally conveniently situated and are all visible from above without having to turn the camera round to alter the settings.

The Super Ikonta $2\frac{1}{4}'' \times 2\frac{1}{4}''$ takes 11 pictures on the usual $3\frac{1}{4}'' \times 2\frac{1}{4}''$ film and is equipped with Zeiss Tessar f/2.8 (the fastest lens fitted to a roll-film camera of its size) and Compur Rapid shutter to 1/400th second.

The shutter release is conveniently placed on the camera body; the film wind and shutter release are interlocked to prevent unintentional double exposures, and the film winds on to a definite stop for each exposure, so really all essential movements are automatic.

There are other models providing somewhat similar advantages for $2\frac{1}{4}'' \times 1\frac{3}{4}''$ and $3\frac{1}{4}'' \times 2\frac{1}{4}''$ pictures.

VOL. LXXXIV. No. 2559.

THE entries in our Annual Lantern-Slide Competition exceeded by a very large number any previous slide competition held by this paper, and again demonstrated the increasing popularity of this form of pictorial photography, in spite of the counter attractions of amateur cinematography. The judging also occupied a greater time than on previous occasions, as in addition to the larger quantity the standard of work was exceptionally high. There were practically no poor slides included amongst the entries, but, on the contrary, the number of first-class productions was so great that deciding on the best was a very difficult matter. The final selection was only arrived at after many of the slides had been put through the lantern four or five times, and all aspects, both pictorial and technical, compared. As a result the prize set this year is a remarkably fine one, and more slides than usual have been included. The set will start on its travels next week, when we are publishing the complete award list. Hon. Secretaries who have delayed applying for the 1937 prize set of "A.P." slides should note that there are now no vacant dates until after May, 1938.

The R.P.S. Appeal.

The Royal Photographic Society Luncheon given to the Press at the Savoy Hotel last week attracted a very large number of newspaper representatives. We feel, however, that the purpose of the function, which was to broadcast the appeal of the R.P.S. for funds for their new home, and to demonstrate the rightness of their appeal as the premier society in the world of

TOPICS of the Week

*Their Majesties the King and Queen
arriving at the Palladium for the Royal
Command Performance.*

*An article on the photography of this
event is given in this issue.*

photography, was not stressed enough. Several good speeches were made, and many interesting facts stated by the speakers regarding the present position of photography, but there was the impression that the speakers did not link up their remarks with the necessities of the Society as strongly as they could have done. For instance, both the Postmaster-General and the Public Relations Controller of the B.B.C. had some interesting information to give about the use of photography in their respective departments. The Postmaster-General said that a new series of posters based on photography explaining the work of the Post Office had just been issued to schools. The cinematograph had also been largely employed to interpret the Post Office to the public. Apart from publicity, the engineering department made about 8,000 negatives a year for its technical work. The reproduction of stamps by a photogravure process and the service of picture-telegraphy were other directions in which photography came into the G.P.O. ambit. Sir Stephen Tallents, for his part, said that the B.B.C. employed the whole-time services of six photographers, whose annual output was nearly 5,000 portraits. It had its general photographic library of 85,000 pictures. Then, of course, there was television, and he mentioned that on the occasion of the Armistice service in Whitehall there was used for the first time a camera of much greater sensitiveness than had ever been employed before, and the results came through excellently. Another field of service for photography was mentioned by Col. Moore-Brabazon, who said that ordnance maps were no sooner made than they were out of date, and that

aerial photographs would be the maps of the future. We think, however, that all these statements would have had a greater effect for the purpose in hand if they had been definitely co-ordinated with the activities of the R.P.S. and used as an argument in favour of the Appeal.

Photographing a Command Performance.

The Command Performance at the London Palladium last week, attended by their Majesties the King and Queen and the Duke and Duchess of Kent, probably attracted more attention than any previous performance of a like nature. The reason for this is due to the fact that the entire programme was broadcast and millions of listeners in this and other countries were able to follow every turn and incident from the arrival of their Majesties to the final National Anthem. Needless to say, the event was duly recorded in all the newspapers the

following morning and the photographs that accompanied the notices were in most cases so good that we approached the editors of some of the papers, and also the news agencies, for details concerning their production. This we feel sure will prove of interest to our readers if only for the technical data that may prove useful for similar work, and an illustrated article on the subject appears elsewhere in this issue.

Like Saying "Jack Robinson."

Some people don't want much. There was Mr. Tom Purvis, for example, whose work with the miniature is well known, telling a meeting of the Miniature Camera Group at Russell Square that he wants a camera which he can take out of the side pocket of his coat, flick nonchalantly in the face of his object, and put back in his pocket again, all within a matter of five seconds or less. And none of the miniatures on the market being quite able to

meet his exorbitant demands, he has had one built, which is on the market, or is shortly to be on the market, we understand, at the astonishing price of fifty shillings. It has three speeds, the speed being determined by the way you hold it up, of $1/25$ th, $1/150$ th and $1/450$ th of a second, and its simplicity is such that Mr. Purvis said that he could take it out of his pocket and operate it with one hand while he drove his car with the other. He could even ride on a roundabout and snap an adjacent roundabout revolving in the opposite direction. The apparatus weighs 12 oz., the negative is $1\frac{1}{4}$ -in. square, the lens is a good specimen of anastigmat, the body is of bakelite, it is set at $f/6.3$, and the work it will do—well, there was a heap of very good enlargements to prove it. What do you want more? Simple in operation as a box camera, efficient as a focal-plane, amenable to control at the lift of a finger—there you are!

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Glycin for Chloro-Bromide.

Will you please suggest a good all-round glycin developer for chloro-bromide papers? A. A. (London.)

Here is a single-solution formula:

Glycin	$\frac{1}{2}$ oz.
Hydroquinone	$\frac{1}{2}$ oz.
Sodium sulphite	7 oz.
Sodium carbonate	$6\frac{1}{2}$ oz.
Potassium bromide	75 grs.
Water to	80 oz.

You can of course make up a smaller quantity in the same proportions. Here is a two-solution form:

A. Sodium sulphite	2 oz.
Sodium carbonate	$\frac{1}{2}$ oz.
Glycin	$\frac{1}{2}$ oz.
Water to	20 oz.
B. Sodium carbonate	4 oz.
Potassium bromide	10 grs.
Water to	20 oz.

Take A, one part; B, one part; water, two parts.

Set of Lenses.

I have come into possession of a set of single lenses in a case, with a mount into which they all screw, and an iris diaphragm. Lenses and stops are marked with figures only. Can you give me some idea as to using the lenses? B. L. (Epsom.)

You have what is generally known as a casket set of lenses, once rather popular for use with cameras having a focussing screen, and also sufficient extension for the longest focal length available. It is a cheap and simple method of securing a number of lenses of different focal lengths.

These casket sets varied very much in quality and price,

but each set was originally accompanied by details of the focal lengths of the lenses, the size of plate each would cover, and generally the f / values of the stops according to the lens with which they were being used. You can easily ascertain these facts for yourself with sufficient accuracy provided you have a suitable camera.

First take the single lenses. Screw one into the back of the mount with the convex side facing the screen; open up the diaphragm and focus on a distant object, getting the image somewhere about the middle of the screen. Now measure the distance from the back of the lens to the screen, and note this as the focal length.

When you have got the focal lengths of all the single lenses you can work out the foci of the possible combinations. Screw a pair into the mount, and measure their separation—the distance between the glass surfaces facing one another. If you call the focal lengths of the two lenses X and Y, and the separation S, the focal length of the combination is

$$\frac{X \times Y}{X + Y - S}$$

For example, suppose the separate lenses are 4 in. and 6 in., and the separation 2 in., you get

$$\frac{4 \times 6}{4 + 6 - 2} = \frac{24}{8} = 3 \text{ in.}$$

You can test each combination in the camera, and get an idea of the definition and covering power. The separate lenses will be "single" or "landscape," the combinations "rectilinear" or "wide-angle rectilinear."

To find the f / values of the stops, rule a line equal to the focal length, measure the diameter of the diaphragm opening with dividers, and see how many times the diameter can be stepped off along the line.

The PHOTOGRAPHIC ALBUM

The fact that the brass-bound heavy-covered tomes which used to contain the family photographs in grandfather's day have passed into peaceful oblivion is no excuse for the amateur photographer ignoring the photographic album as a useful part of his equipment. The following article deals with this subject from the modern amateur's point of view.

IT might well be said that a photographic album is a necessary part of the modern amateur's equipment, quite apart from its æsthetic value as the holder of his camera records.

The modern miniature camera makes enlargements necessary for the full appreciation of the pictorial value of the negative, and the fact that larger prints cost considerably more than small contact prints means that many negatives which have been exposed will never reach the enlargement stage, simply because they are mediocre records of ordinary subjects.

Of course, the really expert pictorial photographer never exposes a negative that is not worth enlarging—or does he?

The Function of the Album.

It seems, therefore, somewhat of a pity that those more ordinary subjects, which gave us pleasure at the time of taking, must be cast aside on the heap of forgotten things.

But with the aid of a modern photographic album—and there are many on the market—small contact prints can be attractively combined, and there is the added advantage that with appropriate lettering or numbering we can keep a record of those negatives which seldom see the light of day. Also, should an occasion arise when, perhaps because the subject has gained notoriety for some reason or other, these negatives attain a commercial value, then the finding of the film or plate is a matter of minutes instead of being, as it well may be, a matter of hours.

Records.

Holidays, birthday and other parties, excursions, always produce a crop of record photographs. And very jolly they are, even though they may never grace the exhibition walls. Neither will whole-plate or larger prints be made from many of them; but jolly little contact prints, or very small enlargements, can be inserted in an album and a happy record of pleasant times perpetuated.

Types.

Albums may be divided into two classes from the photographic point of view—the slip-in or the stick-in.

The experienced photographer usually uses the latter, and the wisdom of this is more apparent when one has a large circle of friends, each of whom wants a print, and who would not hesitate to wheedle that last one out of the album if it could be easily removed. Another important consideration is that one is not confined to any particular shape or size, and a set of prints can be arranged on a page to the owner's particular fancy.

The small "slip-in" album is not to be despised, but, taking everything into consideration, the "stick-in" scores every time.

Varieties galore exist: Fancy covers, plain covers, silk-tasselled, loose-leaf; but the style does not really matter, what does matter is that the paper on which the prints are to be mounted must be free from hypo and other impurities, so that it is best to invest in a well-known manufacturer's goods.

For the Family.

One complete album could be kept specially for the family record, little Tommy, grandpa, mother, and even Fido, being included therein in various stages and under various guises. Even the wealthy aunt from whom one has expectations can be included provided a pleasant photograph can be obtained of her, but don't forget that some people are more sensitive than others.

Mounting.

With the stick-in album some method of mounting must be utilised, and the worker has a wide choice.

Fancy corners have come much into fashion for this purpose recently, the corners being gummed for fastening to the leaf of the album, and the prints being inserted therein. One drawback to these corners is that, particularly the coloured ones, they distract the attention from the print, which is, of course, to be deplored. The transparent ones are better in this respect, and are extremely useful.

Paste forms the most popular medium for mounting, and a good photographic mountant, which is really cheaper to purchase than to make at home, does the job effectively and

cleanly. The mountant should be well rubbed into the back of the print, working from the centre outwards, making sure that each edge is pasted, but that no surplus will squeeze out when the print is pressed into contact. Such a method of mounting will last for years.

Dry mounting is sometimes resorted to for larger prints; this consists of putting a sheet of dry-mounting tissue between the back of the print and the album leaf and making it adhere by ironing with a hot iron. The fact that the amateur will most probably wish to mount his prints on both sides of the leaves rather detracts from the efficacy of this method and, on the whole, paste is to be preferred.

Grouping.

Incongruous collections should be avoided when making up each page of the album. An effort must be made to make each print relevant to the others on that particular page, and it is an excellent idea to keep to one subject if this is at all possible, as it is in the case of holiday photographs, when all the bathing beach scenes can be put in together, all the frolicsome incidents on another section, and picture records of places visited on yet another.

Titling.

A good deal of value is added to an album if the prints are effectively titled, or some slogan connected with the event depicted may be placed underneath. This is excellent practice for the titling of your exhibition prints.

Luxury.

A word may be added about a more luxurious method of album-making. This involves the purchasing of a somewhat expensive album capable of containing, say, three dozen prints not smaller than about 10×8 in. In this should be inserted only outstanding prints up to good exhibition standard. They should be mounted on one side of the leaf only, and the album should be interleaved with tissue paper. It will take some time to fill, but should be well worth showing.

Portraits

By F. ALSOP PARTINGTON.

The Russian Costume.

IN the days when I first used a camera, indoor portraiture, of a reasonably high standard, was entirely in the hands of the professional. It is true that some of the bolder spirits amongst the amateurs experimented, but the handicap of slow materials, small, ill-corrected lenses (except at a very high price) and a limited choice of printing paper doomed most of us to mediocre results from the start.

Now the tables are turned. Professionals very often find their artistic yearnings thwarted by the whims of the sitter. We can always choose our models and attempt effects to please ourselves. If we fail, the fault, as Cassius put it, lies in ourselves.

Most of us start work in this direction by making portraits of our relatives and friends, and, with care, find that they compare favourably with the work of the experts. Soon we begin to search for more ambitious effects and then nothing can be more pleasurable than experimenting with costume.

An Eastern Dancer.

The Ballet Dancer.

This has three obvious advantages over "straight" portraiture, in the artistic sense. First, most people, particularly female, enter into the spirit of the thing and lose their camera shyness.

Secondly, a portrait in costume is not so personal—we see it not so much as someone we know but as an effect depending largely on pose, lighting and arrangement for its success.

Thirdly, we are not limited by the number of models available, but by costume. I have purposely illustrated this article with photographs of the same model to show how much variety can be introduced.

You may think at first that it is almost as hard to find costumes as models, but quite striking effects can be obtained by using odd bits of material and a little ingenuity.

in Costume

Portraits in costume form a very pleasant variant on the usual simple "likeness" of the sitter in everyday clothes. A sitter in fancy dress is much less self-conscious, and poses more naturally, so easing enormously the task of the amateur portrait-maker. The results, too, are much more often pictorial, and if sitters are hard to find variety can be had from just one model by using different costumes. One model only provided all the pictures reproduced here.

For instance, a length of lace and a piece of cardboard to support it on the head can be made into a convincing mantilla. You may have friends who have taken part in theatrical shows. They are usually pleased to be photographed in costume and quite often they provide one or two unexpectedly good exhibition prints.

The important things to consider before setting to work are lighting and background. Batteries of arc lamps are unnecessary. All we need at the beginning is a general light of, say, two 100-watt lamps on a support about 7 ft. from the floor, and a portable 100-watt lamp. Each light should have a reflector (the household white porcelain variety will serve the purpose). A white cloth hung over a

Portrait of a Dancer.

Spanish.

clothes-horse will act as a general reflector, or a permanent one can be made by fastening a piece of poster-paper on to a wooden frame.

I prefer to use these ordinary electric light bulbs to the less permanent "flood" bulbs because the effects can be noted more leisurely, and they give a softer quality. Exposures need not be unduly long. For instance, with light walls and an $f/4.5$ lens, $1/5$ th or $1/2$ second is my usual exposure, according to the position of the lights.

Within the limited space available in the average drawing-room a short-focus lens, such as is fitted to most small cameras, is advantageous when taking half or full figure, providing it is used carefully. Keep the subject as near to one plane as possible to avoid distortion. A hand extended towards the camera will appear far too large in comparison to the face on a print.

Backgrounds should be simple or decorative, but never haphazard. Plain walls, curtains or hangings are, as a general rule, the most successful.

After a while modifications of the "normal" system of lighting will occur to you, such as lighting from above or behind the figure. Such experiments are half the fun of this branch of photography.

Development should not be too long; slight under-development can always be corrected by the use of a contrasty paper, but a harsh negative of a portrait subject is never successful. About two-thirds of the development time you would give to an outdoor subject is generally about right.

Readers' Hints, Tips and Gadgets

DELAYED ACTION WITH VARIABLE DELAY.

THE amateur whose camera is not equipped with automatic release, and who would like to experiment with such exposures, will find the following gadget helpful. It costs practically nothing, can be finished by anyone in a few moments, and yet will serve the purpose quite satisfactorily. The idea can be applied, with slight modifications, to practically all the common types of camera-shutters, from the "box" to the Compur, or even to the focal-plane of the heavy reflexes.

Fig. 1. Delayed-action release for a box camera.

For the Box Camera.

All the materials needed are an elastic rubber ring, a few inches of strong sewing thread, and a small wedge of wood or cardboard about half an inch high.

Fig. 1 illustrates clearly how these articles are employed. The shutter is set for instantaneous exposure. One end of the thread is tied to the trigger of the shutter, the other to the handle of the camera or any other suitable anchorage on the top, leaving a slack in the middle portion. By inserting the

wedge of wood, the thread is rendered tight and the trigger is thereby held in the position of rest. One end of the rubber ring is attached to the point of anchorage on the top of the camera, the body is stretched over the opposite side of the box, and the other end is hooked round the trigger from below, so that the elasticity of the rubber tends to pull down the trigger, but is prevented from doing so by the thread. The self-timer is now finished and set.

To release the shutter, use is made of a "fuse" or touch-paper. A thick, rather fluffy cotton thread, impregnated with a saturated solution of saltpetre (potassium nitrate) and allowed to dry in the air, makes an excellent fuse. A suitable length of this is tied by one end to the impeding thread of the delayed-action release, just below the wedge, so as to hang down clear of the camera body (this prevents any risk of damage to the camera). If now a lighted match be applied to the free end of the fuse, the latter will slowly smoulder until the burning point reaches and severs the impeding thread; the rubber band now pulls down the trigger, and the exposure is made.

The photographer should determine for himself the length of fuse needed to give him sufficient time to assume his position in the field of view. Usually ten to fifteen seconds will be found ample. The duration of the preparatory period may be made as long or as short as desired by taking a suitable length of fuse.

For Cameras with "Ever-set" Type of Shutters.

Parallel arrangements may be used, anchorage for the rubber ring and the thread being found in the baseboard, as shown in Fig. 2. The wooden wedge is inserted under the baseboard, prefer-

ably to one side, and the fuse is applied to the thread at the point close to its apex. If preferred, hooks made of stiff wire may be employed for anchoring the thread and the rubber ring to the baseboard.

For Cameras with Compur Shutter.

For a Compur shutter all that is required is 8 to 10 in. of thread. First the shutter is set in the usual way. One end of the thread is then fastened to the setting-lever of the shutter; the other end is tied to the baseboard in the

Fig. 2. Delayed action fitted (right) to ever-set shutter and (left) to Compur or other shutter with setting lever.

manner previously described, so as to hold the lever back in its set position. When everything is ready for the exposure, the trigger is pressed, but as the setting lever cannot fly back, the shutter does not open. Release of the lever and opening of the shutter can be brought about by the use of the fuse as in the previous cases. There is no need to hold the trigger down, as the slight stretching of the thread allows the setting-lever to move just the tiny amount necessary to prevent it from catching again when the trigger is allowed to return. O. KETU-SINH.

AN ANGLE VIEW-FINDER.

A RECENT article in *The Amateur Photographer* on "Photographing Sideways" gave me cause to regret the fact that no angle finder was available for my camera, a Baldax; so I set about making a gadget to serve this purpose. A similar device can be easily made to fit several other cameras fitted with direct view-finders, such as the Baby Ikonta, Vauxhall, Norfolk, Kodak, etc.

A small block of wood is cut to fit firmly, but not so tightly as to cause damage, into the direct view-finder. With the aid of a protractor (one can usually be found on the back of a 12-in. ruler) a diagonal line is drawn across the top of the block of wood at exactly 45 degrees to the front lens. A vertical line is then drawn along the outer edge

of the block where the diagonal line cuts it, as shown in the smaller sketch.

The piece of wood is then removed from the view-finder and cut carefully down the diagonal line to form two wedges, the one that was adjacent to the back lens of the finder being retained for the purpose of making the angle gadget. A small piece of mirror is cut the same size as the sawn side of the wood, and stuck on with strong adhesive.

To use this device as an angle finder it is only necessary to slip it into the direct-vision finder and look along the top edge of the camera, as shown in the sketch.

It will be found that the angle of view included is slightly less than is actually included on the film; but this is on the safe side. The device can be fitted or removed in a second and slips easily into the pocket when not in use.

FRED MAYERL.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

The Miniature in the Service of Advertising

By A. M. CAMPBELL.

THE number of amateurs who enter their pictures for photographic competitions is legion. To their number belong also those who send pictures to the press for general publication. Strangely enough, however, the advertising field is still more or less unexplored. Yet advertising in its many phases offers a vast market. The writer would even go so far as to say that there are more opportunities for the free-lance photographer here than in any other sphere. The market is also a lucrative one for the right kind of pictures.

It is hoped that this article, by describing one particular instance, will open up a train of thought in the minds of readers. Much remains to be done to improve advertising illustrations. The intelligent amateur has already worked wonders in the way of press photography. He can do so also in advertising.

Boats and cars seem to have little in common. Here is the link: "Next month will see the end of the season's yachting, but you still have time to feast your eyes on dancing sails. Your used car will take you to all the yachting centres."

This photograph of a Ford V8 car has been used by the makers of the car as an illustration in their monthly journal.

For those photographers who, like the writer, specialise in pictorial subjects, motor car firms and similar concerns are the most likely customers. It was to a Northern Ireland motor firm that a lengthy series of photographs was sold, each picture illustrating a different feature of local scenery. The idea, of course, was to get readers interested in different parts of

This woodland picture was used to advertise second-hand cars by the wording: "'Tongues in trees, books in the running brooks, sermons in stone, and good in everything.' Realise the truth of Shakespeare's assertion by visiting Ulster's delightful wooded stretches in a used car supplied by Ferguson's."

the country, and to point the moral of seeing them from a car supplied by the firm in question.

Enlargements in glossy black-and-white were prepared from the original Baby Ikonta negatives, in a size half as big again as they would actually

Connected with cars by "Harvest-time brings added colour to the countryside. Gone are the vivid greens of early spring and summer; in their place are garnered crops and yellow stacks. See Ulster in autumn. See it from a Ferguson used car."

The advertising matter accompanying this picture of a bridge was along the lines of the other examples given, the text of the advertisement being "the long days of leafy June."

appear in the advertisements, viz., one and a half times the size of the finished product. (Blockmakers can make a better job of photographs if the originals are slightly larger than the required result.) These were mounted on white card and lines were drawn to represent lines of written matter, in order that the motor firm might have some idea of what the advertisements would look like in the newspapers. This done, it remained only to think of wording to link up the various aspects of the countryside with the idea of the motor car. Thus one of the advertise-

ments speaks of "stately trees and a glimpse of a blue lough," another treats of yachting and the different sailing centres, whilst another illustrates with a picture of corn stacks the beauties of the country in harvest-time. The pictures and suggested wording were shown to the advertiser, who approved of them at once, and gave instructions to go right ahead with a complete series.

Bold Subjects Reproduce Best.

It was found that many good photographs had to be rejected on one score. They were good enough pictures æsthetically, but inclined to be fussy when considered for newspaper reproduction. To allow for this factor it was necessary to choose pictures of a bold type and rather contrasty, and those which depended upon detail for their effect had to be discarded.

Besides motor firms the would-be advertising photographer might very well devote some attention to the actual manufacturer of cars. If he will first find out which of them run monthly magazines and then submit photographs of their cars in suitable surroundings, he should have little difficulty in working up a connection. It, too, he can write articles around the district with which he is familiar, he will improve his chances immensely.

Other likely purchasers of the amateur's photographs are travel agencies and tourist associations, publishers of travel books,

makers of photographic film, and calendar publishers. To most of these the writer has sold pictures. It is seldom necessary to relinquish copyright, and even when that course becomes necessary it will usually be found that the purchaser is willing to pay for it.

As far as advertising photographs are concerned it will often be found that it is the *idea* behind the picture, rather than the photograph itself, that appeals to advertisers. This is not to be construed into meaning that technical excellence is unnecessary. It means that advertising photographs should contain some sort of human appeal, something that will gain for them the attention of the man in the street, the man after whom every advertiser is striving.

"Amusement! Away with worry about the time of the last tram! No more anxiety about 'bus and train connections! With a Ferguson used car you are master of your own leisure and amusement."

Dust and the Folding Miniature Camera By GEORGE CRICK.

USERS of the useful folding miniature cameras which take sixteen $6 \times 4\frac{1}{2}$ cm. pictures on $3\frac{1}{2} \times 2\frac{1}{2}$ film, unless working under ideal conditions, will often encounter a serious difficulty—the prevention of dust spots on their negatives.

If it is at all possible, flaws of all kinds should be prevented in these tiny negatives, for only an expert can "spot" them satisfactorily. I am forced to work in fairly dusty surroundings and my first miniature camera negatives were very spotty. I wanted to make really big enlargements on glossy bromide paper, so some of the negatives were quite useless.

It was noticed at the time that no matter how carefully the inside of the camera was cleaned before loading with film, there was always dust inside the camera again after the film had been exposed and was removed for development.

The wooden film-spools were suspected at first, as some of the dust appeared to consist of minute particles of wood. It is a pity that the fine-grain films are sold on these wooden bobbins. If the user of this type of camera ever buys a film wound on a metal spool, the spool can be used repeatedly as the take-up spool in the camera. This will reduce trouble from this source.

The film itself was also thought to be faulty. It is not uncommon to find pinholes in unexposed plates. Film of other makes was tried. There was no great improvement. In any case, it is not advisable to switch from one make of film to another as it is necessary to develop several rolls of a particular film before its latitude and optimum development time are known. I am now convinced that all the fine-grain film offered by the leading manufacturers is absolutely above suspicion.

After being baffled for a long time, it was suddenly realised

that every time the camera was snapped open, air was sucked into the camera by the bellows. This air drew the dust in with it. It became evident that the outside of the camera as well as the inside must be kept perfectly clean, and that the more gently the camera was opened the less dust would be sucked into the camera and deposited on the unexposed film.

This applies to all folding cameras, which have to be generously ventilated (if they were not the bellows would collapse when the camera was opened). The camera should not be opened and shut more than is necessary, and should be kept in a clean, dust-proof case.

I also decided to wind the film immediately before exposure instead of after it. The dust then settles on exposed film, and provided that the dust is not of a chemically active nature, it does no particular harm. The adoption of this procedure has given me much cleaner negatives. If anyone else cares to give it a trial, it is only fair to mention that habits are not easily broken and that some double exposures will be made at first. But, after all, the plate camera user has to insert a slide in his camera, so why should not the miniaturist wind a film into place before making an exposure?

To sum up—clean the camera both inside and outside; open the bellows gently; use metal spools when possible; and wind the film just before making an exposure and when the camera is open. There should be a decided improvement in negative quality. In fact, it is possible to develop spool after spool without finding a single spot. The modern miniature camera is such a wonderful instrument that it is well worth while developing a technique to suit it.

November 24th, 1937

Modern Miniature Enlargers

As enlargers are likely to be of more interest to many miniaturists at this time of year than are cameras, we propose that for the present our weekly review should deal with the various enlargers for miniature negatives. But if a new miniature camera should be introduced, enlargers will be put aside for a week to allow us to review it at once.

THE NOVOREX.

THE Novorex is a British-made vertical enlarger for 6×6 cm. negatives, and has only just been put upon the market. The general construction can be seen from the illustration, though this necessarily gives but little idea of details.

As received from the makers, the enlarger is in four main parts: the baseboard, the upright, the lower half of the projector-head, complete with lens and focussing arrangements, and the upper part of the head, including lampholder and wiring. To assemble it is the work of ten minutes only, and no tools other than a screwdriver are required.

The baseboard, which will accommodate paper up to 19×18 in. without overlap, is made of ½-in. plywood and stands on rubber feet to allow space beneath it for the wiring, which is done in a tidy and workmanlike fashion.

The switch hangs from the front of the baseboard on about a foot of stout flex. The upright of chromium-plated steel is 36 in. in height, and the projector head slides smoothly up and down it, and is held at the required height by a screw clamp.

The lower part of the projector head is massively built, and carries a 4-in. f/4.5 Aldis anastigmat with iris diaphragm. Focussing is by helical thread, and covers a very wide range. The movement is extremely silky, and is likely to remain so indefinitely, for the moving tube is of very large diameter. An orange filter to swing over the lens is standard equipment.

The negative-carrier consists of two metal plates with glass inserts; the edges of the glasses are levelled to prevent scratching the film. It is designed to take film in the strip, supports for the rolled-up film being provided at each side of the carrier-slot. Quick release to enable the film to be moved is provided by a lever. Separate negatives, either on films or plates, can equally well be used.

The illuminant used is an opal lamp of 60 or 100 watts, as preferred; in conjunction with the double condenser it gives a brilliant and evenly illuminated image. Ordinary bayonet fitting is used; not the Continental screw-cap.

With the projector-head at the top of the upright, a magnification of 7.2 diameters is obtained, so that the projected image of a negative of the full 6×6 cm. size measures 17×17 in. Parts of a negative would be enlarged in proportion. By swinging the head round to project off the baseboard, enlargements of any size may be obtained by having the bromide paper far enough away. The minimum degree of enlargement is 1.9 diameters, so that the full 6×6 cm. negative would occupy an area 4½×4½ in.

The only point about the Novorex that we could criticise is that the upright is inclined to be a trifle springy, especially if the projector head is raised fairly high. Vibration during a prolonged exposure could, however, be guarded against by using the switch, and not the orange filter, to begin the exposure.

The Novorex is sold by the manufacturers, Turner's Camera Exchange, 9, Pink Lane, Newcastle-on-Tyne, at £8, without lens, or at £10 10s. with the f/4.5 Aldis lens mentioned. A taller upright (4½ ft.) can be had for 7s. 6d. extra, and masking frames are also available.

Miniature Camera Gossip

By LANCELOT VINING.

I HAVE now been "Gossiping" for a year, as this feature had its first birthday last week, and I know that during the past twelve months I have made many friends and I hope no enemies, but there are still many readers of "The A.P." who seem to "have me all wrong." One recently wrote to say how much he enjoyed "my" paper, and dozens write to ask questions about cameras in which I have no interest. Last week I had fourteen queries to answer, so to clear the air a little I would like to say that I am not on the staff of "The A.P." but am just a weekly contributor, and one with very little spare time at that.

My interests are in 24×36 mm. photography (real miniature) and I am always ready to give any help and advice on matters relating to this size, and, of course, on any F.G. films and developers I may have had experience with. But these are not very many, for once I have found film and developer to suit my work I only experiment with new

THE "ROYAL" AT THE MONICO. 1/10th at f/1.5, I.S.S. film.

solutions; (4) Table of development times for various concentrations, tanks and their sizes in regard to solutions, number of films per tank, bromides and gaslight papers.

If I tried to answer all the questions set me, I should be busy for a week. And, anyway, he should write to Johnson's, not me, for information of that sort.

For Ladies Only.

When the sister of a Fleet Street colleague asked me if I would visit her West End salon and photograph some really novel lingerie designs, I had to do a little "courage plucking." I would not have mentioned this escapade had I not been so pleased with the results. And I felt that my women readers were entitled to see just one.

There was very little daylight, but with the help of two standard lamps my meter registered 1/25th at f/2.8. It is needless for me to add that I was provided with a very charming model, but I might point out that the music is the opening bars of "When I am too old to dream."

The "Royal" Dinner.

This will have been dealt with, probably last week, in another part of the paper. I need only say that I was very fortunate in being placed among a very cheery party, headed by the Miniature Group Secretaries.

Before the alterations to the new home of the R.P.S. at Prince's Gate are started, may I make a plea for a special darkroom or workroom for the 24×36 mm. workers, where experiments could be carried out and useful data obtained. We meet with problems never experienced by owners of small cameras using 5 or 6 square inches of film at each exposure.

MUSIC YOU DON'T TAKE TO THE PARTY. 1/25th at f/2.8, I.S.S. film.

materials when I think they may offer some real improvement.

A Sample.

I received a letter from the North in which the writer suggests in regard to Meritol-Metol I should deal with: (1) Development times for all the popular films; (2) Rise and fall in time per degree above or below 65 degrees; (3) Several questions on making up

Inexpensive Miniature.

"BEASTIES" and the Miniature

By

DUDLEY H. DIBDIN.

Taken with Baldina camera (24 x 36 mm.). 1/50th at f/8, on Isopan F. film

MANY photographers buy a miniature camera because it is fashionable to own one. I bought mine because I wanted a camera that really was pocketable so that I could always have it with me.

"Be Prepared" is a good motto for photographers; and no photographer is better equipped to live up to this motto than the owner of one of the "cheaper" miniature cameras, which have one definite advantage over most of their more exalted brethren, in that they really are pocketable.

In my pockets I nearly always carry my miniature; a yellow-green filter; a "Leudi" exposure meter and a good lens hood—and these are all so "miniature" that they are quite unobtrusive.

Incidentally, I consider that on purchasing a camera, the above-mentioned accessories should be considered a part of it and purchased at the same time. The

extra outlay involved will be repaid many times in better results; few failures through under- or over-exposure; and being able to tackle a wider range of subjects. One of my favourite photographic "hobbies" is to take pictures of the ornamental dragons, fish, queer lions, and gargoyles that decorate churches, fountains, statues, etc.

The photographs that illustrate this article were both taken from an old "memorial" cannon that stands on the Horse Guards Parade, which I "discovered" during a lunch-time stroll. London is a veritable gold mine for such subjects; but there is hardly a town or village in the British Isles that could not supply similar subjects for the miniaturist.

I find the f/2.9 lens fitted to my miniature to be particularly useful when the "beastie" to be photographed happens to be lurking in a darkish corner.

WAR! Taken with Baldina. 1/50th at f/3, on Isopan F. film.

NEW DEVELOPMENT TABLES.

WE have received an advance copy of a new leaflet that will be issued by Messrs. Johnson & Sons with each bottle of their proprietary developing agent Meritol. The leaflet contains formula both for the well-known developer containing Meritol alone, and also for the newer combined Meritol-Metol developer, together with revised and up-to-date development times at 65° and 70° Fahr. in each developer for 34 different films.

For the convenience of our readers, we reproduce the two formulæ below.

Meritol.			
Sodium sulphite (anhydrous)	800 grs.	(90 grm.)	
Meritol	140 grs.	(16 grm.)	
Water to	20 oz.	(1,000 c.c.)	

Meritol-Metol.			
Metol	20 grs.	(2.3 grm.)	
Sodium sulphite (anhydrous)	800 grs.	(90 grm.)	
Meritol	120 grs.	(13.7 grm.)	
Water to	20 oz.	(1,000 c.c.)	

In each case dissolve the chemical in the order given, in warm water. If crystallised sulphite is used take double the weight given for the anhydrous salt.

Space does not permit of reproducing here full data of development times, but those who have a supply of Meritol already in their possession, or who may purchase a bottle issued before the new leaflet was published, should write to Messrs. Johnson & Sons, Ltd., Hendon Way, Hendon, N.W.4, for a copy of this leaflet.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

RANGE-FINDER OR REFLEX FOCUSING?

I am intending to replace my present camera with one taking film in either V.P. or "16 on 3 1/2 x 2 1/4" size if you think so small a negative large enough for general work. Would a single-lens reflex or a range-finder camera be the more accurate in focusing? And which type would be the better suited to all-round work?

D. A. A. M. (Folkestone.)

We regard a camera taking negatives of V.P. size (or 16 on 3 1/2 x 2 1/4 size) as large enough for general work of all kinds, provided that the camera is a first-rate instrument. To cover the widest range of work, we should prefer a true reflex rather than one equipped with a range-finder, as in this size of instrument it is only the reflex that lends itself to the use of interchangeable lenses. On grounds of focussing, however, we should perhaps be inclined to prefer the range-finder type, not as being more accurate, but as being more rapid to focus.

UNEVEN DEFINITION.

I have made myself an enlarger for 24 x 36 mm. negatives, to which I have fitted the lens from my camera. Although this lens gives splendid definition in the camera, when I use it in the enlarger I cannot get both sides of the picture sharp at the same time, though I can focus for either at will. Can you tell me how I can overcome this difficulty?

S. P. (London.)

It is evident that the adjustment of your enlarger is at fault, and it would seem almost certain that the lens-panel is not parallel with the negative. A very small error here would be sufficient to cause the trouble you describe, and you may have difficulty in setting matters right. We suggest you loosen the lens-flange a little, and experiment by slipping pieces of paper under one side or the other until you have tipped the flange over to the necessary small extent. We leave to you the means of making the correction permanent; details of this must depend on the construction of the enlarger.

CHOICE OF CAMERA.

I want to take the usual run of outdoor subjects, and like the idea of a small, compact camera that can be used in the hand for practically every subject. Would a Leica or a Contax be suitable, or are they too good for my purpose? W. L. T. (Chelmsford.)

We think you would be completely satisfied with the performance of either a Leica or a Contax, and we do not see that any question of their being too good for your purpose need arise. The power put into your hands by either of these cameras will we think, speedily extend the range of your subjects.

HARDENING FIXER.

As I find my miniature negatives tend to get scratched in handling, ought I to use a hardening fixer? And if so, could you give me a formula for one?

J. B. (Burnley.)

We think you will find the use of a hardening fixer a great help towards avoiding scratches. You will require to make up the following solutions:—

A. Hypo	20 oz.
Water to	20 oz.
B. Sodium sulphite	4 oz.
Acetic acid	3 fl. oz.
Alum	2 oz.
Water to	20 oz.

To make the working bath add two parts of B to 20 parts of A.

MAKING A POSTER.

The enclosed 4.5 x 6 cm. negative was to have been used for a poster, but for the objection that it is too small to yield the necessary sharpness for such a huge print. Could I make an enlarged negative from this as a basis for fresh enlargement and so get a sharper result? W. B. K. (London.)

An enlarged negative cannot possibly contain more detail than the original negative, so that no gain in sharpness is to be had by the process you suggest. We think your best plan would be to make a big enlargement from your negative and to enhance the sharpness by a certain amount of drawing and air-brush work on the enlargement. This can then be copied and the new negative be used as a basis for the poster. Except where handwork of this type is contemplated much the best method of getting a large print from the negative is to make an enlargement direct.

How the Pressmen Photographed THE ROYAL COMMAND PERFORMANCE

FOR photographing an event as important as the Royal Command Performance held last week at the Palladium, arrangements have to be made well in advance. The various press-agencies and newspapers have to apply to the management of the Palladium, who issue permits at their discretion. No special accommodation was on this occasion placed at the disposal of pressmen, who had to "spy out the land," decide upon the points from which they wished to take their photographs, and have their choice of position confirmed by the Palladium authorities, who were

Taken during the performance from back of Dress Circle. Exposure 2 secs., f/4.5. Hypersensitive Pan. plate.

Their Majesties in the Royal Box watching the performance. Taken with 30-in. lens f/4.8, 3 seconds exposure. Ilford Hypersensitive plate.

naturally anxious to see that the photographers and their apparatus did not obstruct the free passage of the audience to and from their seats, and that there was no danger of a photographer stepping in front of a spot-light at a crucial moment and cutting off its beam.

Exposures and point of view were checked at a dress rehearsal held in the afternoon, at which trial plates were freely exposed. Most of the photographers used cameras of ordinary press type, and of size either 5×4 in. or 9×12 cm., which are the two most popular sizes in Fleet Street. These cameras were loaded in most cases with Ilford Hypersensitive Pan. plates specially supersensitised for the occasion by the makers.

The Grand Finale. 2 secs. exposure, f/4.5, Zeiss Palmos 9×12 camera. Ilford Hypersensitive Pan. plate.

Taken with Mininum Palmos Press camera, f/6.3, 1 sec. exposure. Ilford Hypersensitive Pan. plate. All lights on.

These specially fast plates revert to normal speed within a few days of being delivered.

The most-sought-after spot in the theatre was an alcove close to the box opposite to that occupied by the King and Queen; as the illustrations show, most of the photographs were taken from that point. Others, however, were taken from alcoves at the side of the circle, and from any other point where a photographer could stow himself away inconspicuously.

The photograph at the head of this article, for example, was evidently taken from the side of the stalls. It was taken in two parts, and subsequently joined, the exposure for the auditorium being 3 secs. at f/4.5, and that for the stage (during item 12) 2 secs. Both exposures were made with a 9×12 cm. Palmos camera.

Ciné cameras were not used in the auditorium itself, but one was installed in the vestibule, where the usual lighting was augmented by replacing a number of the ordinary electric light bulbs with Photofloods. In this light exposures of about 1/25th sec. were made at f/1.8, using a 12.5-cm. Ernstar lens from a 3½×2½ camera remounted on a standard pressman's camera taking plates 9×12 cm.

Inside the theatre photographs were mostly taken at f/4.5, the exposures being round about 1 to 2 secs.

An amateur with an f/1.5 lens on a miniature could have achieved similar results with exposures of 1/5th sec. or less, but amateur photography was strictly forbidden.

Perhaps the most amazing feature of the whole undertaking is the speed with which the press photographer produces his results; finished enlargements of the King's arrival in the vestibule and of Their

Majesties in the Royal box were being sent out from Fleet Street before the conclusion of the second item on the programme. And these first photographs were followed while the performance still continued with a continuous service of prints showing the scene at later stages.

As the speed at which prints were sent out suggests, no official restrictions were placed on the publication of these photographs of Their Majesties, but results were rushed out to the various papers, who doubtless instantly proceeded to make from them the necessary half-tone

blocks from which, of course, they were finally printed. And at this stage in the proceedings we, as amateur photographers, lose interest; but we cannot but admire the certainty and speed with which the professional pressman produces results under the most difficult conditions.

At the Conclusion of the Performance. Taken with 30-in. lens, 2 secs. exposure, f/4.8, Hypersensitive plate.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDXIII.

Mr. FRANK
DOBBS.

From information communicated to our Special Representative.

"WHEN I was asked to contribute to this series I was moved by feelings of pride and depression: of pride that my work should be deemed to have reached a sufficiently high standard; and of depression that I should have to try to describe some of my methods in sufficiently interesting form to make it worth printing.

"It seems to me that to describe how one makes exhibition prints is a subject that must be tackled from the beginning, and that is, to my mind, the type of camera used. In my case, the camera is a $3\frac{1}{2} \times 2\frac{1}{2}$ Sinclair 'Una.' It is fitted with Ross f/6.8 Homocentric lens in the usual shutter, and I generally use film-pack stock. In the choice of the latter I have found, after long experience, that it pays (both financially and in results) to get used to one make of material, and work it 'all out' for the best possible results. My own favourite is a well-known orthochromatic pack of German origin, which is fine in grain, and which, coupled with the use of a Borax-M.Q. developer, gives me just the type of negative I like to work with, and, moreover, the whole batch will be uniform in quality and density, all things being equal in other respects.

"Although the 'Una' is a hand and stand camera I prefer to use it exclusively as a stand instrument, as I like to compose my picture on the focussing screen. I may say, however, that not all my exhibition pictures are the result of careful composition on the screen. For example, that of the west front of Peterborough Cathedral by floodlight was the result more of luck than judgment, for very little of the picture was visible on the screen.

"The use of an exposure meter is indispensable, and an electric one is to be preferred.

"Having secured the germs of potential exhibition prints I retire to the dark-room for a protracted period, for I prefer to carry out all the operations visually, usually working on two negatives at a time in the dish. Useless negatives are ruthlessly scrapped. Not all my negatives are destined to become enlargements, but are more likely to be lantern slides. Those that one ventures to hope will work up into pictures are printed off about half-plate size, and after the usual processing are examined for faults and possible trimming improvements.

"I ought to point out that I am not

good at 'doctoring,' and I always feel that a negative giving a print which needs a lot of attention should be destroyed, before time and money are wasted on it; unless, of course, it is in the nature of a record which cannot be repeated without difficulty and expense. Naturally, I have no objection to the removal of pinholes and similar blemishes, and regularly do so on both negative and print.

"The size and limits of the finished print having been settled, it remains to decide on the type and grade of paper to be used. Here again it cannot be too strongly advocated to get used to one brand of paper and the recommended developer. All the better-known makers produce their papers in such variety of surface and grade that there is no excuse for the worker constantly changing about.

"Trimming the finished print is a point upon which I have particularly careful views, especially in architectural work. Mounting can also make or mar the finished result. I consistently use a standard board which has a choice of two surface finishes, white and pale ivory, and find that it meets all my needs. My equipment does not include dry-mounting apparatus, so that I make the best possible job with a recognised mountant rubbed well into the back of the print, which is then transferred to its place on the mount. The face of it being covered with a sheet of clean paper, it is rubbed well down by hand, and the whole placed under a heavy weight until the next day. To complete the work a finely-drawn pencil line border gives a touch of distinction, provided it is neatly accomplished.

"My own work is usually in the field of architectural and detail work, and I suppose it is the attraction of fine craftsmanship that holds my interest in this subject more than in any other. Portraiture also interests me, but I despair of ever producing a landscape in monochrome conveying an adequate impression of the beauty and colour of such subjects. Therefore I seldom make a negative of a landscape save as a private record."

(A further example of Mr. Dobbs's work is reproduced on one of the centre Art pages.)

15TH CENTURY MONUMENT.

Frank Dobbs.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

“COLOMBO,” by Bernard G. Thornley.

THERE is something particularly bold and striking about the subject of our discussion this week. Its force and power are undeniable, and, I think, arise from the unusual nature of the arrangement and disposition of the subject material.

The way in which the prow of the vessel on the right is introduced—starting from the bottom right-hand corner and making straight for its opposite at the top—is much out of the ordinary, and illustrates the strength of the diagonal form of composition in a most unmistakable fashion. It is unusual, too, in that there is not the slightest attempt to disguise the form, unless the fact that it is not allowed to run the full length can be so regarded, but it is employed in such an open and candid way that it gets away with it, for once in a while, without its obviousness becoming objectionable.

It makes the bow of the vessel so strong that its principality is unquestionable, and, with the group of figures at the top as a point of culmination, there is equally no doubt about the centre of interest. The line of the stem leads up directly to the foremost figure of the group (1). It emphasises its significance, and, as the brightest note of the picture is to be found within its outline, the line also stresses the effect of sunlight as the motive. The note of brightness is repeated in diminishing order in the figures in the rear (2 and 3), which are advisedly spaced in irregular formation, and these notes are valuable in enhancing the effect.

But, despite its forcefulness, the diagonal formation is the wrong way up to acquire or impart a sense of stability. If the mass were the other way about, with the widest part at the base, it would have a firm foundation and would be able to stand alone. As it is, the strip of water and the steamboat (4) has to be introduced in

order to provide not only a stable base but an accent in opposition to the overwhelming upward tendency of the line of the prow.

It does the trick quite efficiently, but it is helped, to a not inconsiderable extent, by the downward trend of the ropes and chain falling from the nearer vessel, which oppose its directional impulse. The horizontal line

the author's consideration. He may have been more or less aware that the steamer would make a useful foil and that it might counter the pull of the group, but I should judge that a good deal more was included in the negative than is here displayed, and that the form of the arrangement was chosen after experimenting with a trial print.

And a very good way of working, too! It is so very seldom, in practical work, that there is any time to consider the finer points of composition that it is wiser to leave it to instinct or the feeling for form that comes with experience, and see that there is a sufficient margin in the negative to adjust matters subsequently.

It is a plan that I know is followed by many prominent workers, who, as a rule, concentrate on getting the best aspect of the subject when they make their exposure, and trust to after-treatment to correct any minor deficiencies of arrangement, or to adjust the subject to the picture space. Naturally enough, some regard is paid to the disposition of the various elements in relation to each other, and it may be the case that, in some instances, the setting is pre-selected with the knowledge that something in the way of figures will turn up in the course of time; but conscious arrangement of the composition, in the way a painter arranges his theme, is rarely, if ever, attempted, i.e., at least, in outdoor work of this kind.

Another point that I find attractive, and one that depends almost wholly on good technique, is the way the sunlight on the white-garbed figures is shown against the slightly darker tone of the sky. It is an effect that can most easily be secured with panchromatic material in conjunction with a light filter, but the exposure has to be fairly accurately calculated, and there must be no misjudgment of the time of development. “MENTOR.”

of the steamer (4) and that of its neighbour on the right are also of similar service, and a very interesting and uncommon form of arrangement has resulted. I should, however, be inclined to doubt that it was decided upon or even foreseen at the time of exposure. At a guess, I would assume that it was the group in sunshine that first attracted the attention, and that getting it, without the figures being allowed to become aware of the camera, absorbed the whole of

PICTURES by Novices

*SOME CRITICAL COMMENTS on
the Beginners' prints reproduced on the opposite page.*

IN reviewing the picture entitled "Colombo," in "Pictures in the Making" this week, I referred more or less incidentally to the way the figures in sunlight were displayed in light tones against a deeper sky, and briefly indicated the method by which such a result might be achieved.

White against Blue.

But, under certain conditions of lighting, light-toned buildings in sunshine also appear visually brighter than the blue of the sky behind, and, unless this effect is faithfully portrayed, the photographic representation of them will not be at all satisfactory.

The building in No. 5 of the prints reproduced on the opposite page, "Metropolis," by Thomas Jones, is fairly new, and as it is quite well known to me I am able to say that, with the light falling as it is, the tower would seem to the eye to be appreciably brighter than the sky against which it is shown. In the print, however, there is no more than a hint of the distinction that would be perfectly plain to the eye, and that only occurs towards the very top, whereas it should be the brighter along its whole length.

And imagine the difference if it were. The subject is by no means without attraction as it is, but with that tower glowing in light in contrast with a deeper but luminous sky, it would be far more vital and, æsthetically, it would be miles ahead.

However, as I said on the other page, a panchromatic emulsion and a moderate screen are almost essential to enable an effect such as this to be recorded, and, that being so, I should be inclined to recommend that the picture be retaken, when conditions are similar, but using the material and device in question.

Direction of Lighting.

It is quite probable that, if the lighting were rather more frontal, the effect would be more marked, and, to some extent, advantage has been taken of the fact in No. 6, "Airfree and Carefree," by Miss M. Angus, where the face is shown with excellent modelling notwithstanding the fact that it has the sky for a setting, and it might be expected, under other conditions, to be appreciably the darker.

But, although the result is quite tolerable, the sky is inclined to be washy, and it has not the tone that the "pan" would give. Instead of a *hint* of tone, as here, there would be a definite *certainly* of tone, and not only would it have the effect of displaying the head to better advantage, but it would also provide the picture with a greater measure of harmony in its tonal values.

The sky tone of No. 7, "Dunes," by Alfred Parent, is better, but I rather suspect a measure of overprinting is responsible, for the rendering of the sunlit portions of the sand below the figure seem a bit degraded and the distinctions have not the vitality they should display. The shading off towards the base strikes me as unfortunate, too, for it occasions a suggestion of instability, which, however, can be corrected by trimming half an inch from the bottom of the print.

Space and the Scene.

With the figure placed so high in the picture space, an impression of restriction is created, and it rather seems as though the camera had been inadvertently depressed at the moment of exposure, the effect of which is seen in the exaggerated length of foreground and the limitation above.

No. 8, "St. Catherine's House," by Mrs. E. B. Boyd, shows a better feeling for spacing, although, on account of the camera being tilted upwards, the vertical lines tend to converge towards the top. This is a fault that can be corrected by tilting the negative or easel or both during the process of printing by projection or enlargement, and the point is one that should be kept in mind when a larger print is being made.

No. 9, "In the Right Spot," by Miss M. Walker, is a very small print with a very large sign right in the middle. The figures may be quite well caught, and, indeed, they are very nicely portrayed, but nothing can get over that abominably assertive sign, and, unless the motive is facetious, I cannot conceive why the subject was taken. Such a motive, I feel, is out of place in pictorial photography, and most of us will agree that such an idea is best left to the caricaturist to deal with. Another miniature print, "Clovelly Harbour" (4), by S. H. C.

Woolrych—also shows a well-caught figure nicely placed in the scene, but, on account of its small size, the picture does not stand comparison with the rest of the batch.

A Case for Enlargement.

It has to be looked into before it is appreciated, and, with prints of this size, I am inclined to think that they should be enlarged before they are published.

With the modern automatic enlarging instruments, it is no more trouble and no more difficult to make an enlarged print than one by contact. In fact, if the job be tackled seriously, it will be found the simpler of the two, for it is by no means an easy task to adjust a tiny piece of paper to a tiny negative, nor is it certain, with the average printing-frame, that they will be brought into proper contact, a qualification that is essential if fine definition is not to be lost.

The dog in No. 1, "Here He Comes," by Miss N. Walton, carries out the implication of the title quite well, but the impression loses a lot through the inclusion of that strip of sky along the top. Cover it up or cut it off and the figure of the dog immediately leaps into significance and makes the picture a good deal better. This is a device to which I have frequently called attention.

Sloping Horizons.

An unlevel horizon is an unlovely thing. So often have I drawn attention to the fault in these columns that I had hoped, ere this, the necessity would cease. The fault, however, recurs in No. 2, "Palm Beach," by Looi Tian Geon, and its ill effect is apparent and obvious. Moreover, the rendering of the trees suffers appreciably from the fact that their bases are excluded, and, taking both these things into consideration, I am afraid that the workmanship can only be regarded as lacking in competence.

A somewhat similar impression arises from the haphazard arrangement of lines which should be vertical in No. 3, "An Ancient Porch," by R. N. V. Fairbank, and, besides, there is a falling off in tone on the left-hand side which seems to indicate either uneven development or uneven illumination during the printing exposure. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

MORE ABOUT TRIMMING PRINTS.

A READER who has noticed that I sometimes show long narrow prints asks me to tell him the make of camera I use to get them. It cannot be said that there are no cameras made to give a negative of narrow panel proportions. There are; but they have only very limited use. But it is safe to say that there is no negative size that will not give, at times, a picture very long in proportion to its width. It is a question of selection or trimming.

Very popular and "comfortable" proportions for a picture are somewhere near the ratio of five to four. A 5×4 negative gives 10×8 , 15×12 and 20×16 prints by enlarging it two, three and four diameters respectively. If anything, the proportions are a little too square, and it is often better to add something to the length.

It is the character and arrangement of the subject, however, that play the most important part in deciding the proportions of the picture space; and there are some subjects that demand what is often called a "panel" shape.

The five illustrations are reproduced from entries to a competition, and in each case the whole of the print as submitted is shown. It is evident that the author of Fig. 1 has shown care and wisdom in trimming his print. Quite possibly the negative has the water-line bisecting the picture, and shows an unpleasant "wide-angle" foreground. The splayed-out effect has been modified, and the horizon is about one-third of the way up. The subject is admirably adapted to the picture space.

Fig. 1.

It is still more evident that the author of No. 2 has given no attention to fitting his subject to the space. This subject is the part lying below the ink line. If he had slightly lowered the direction of the lens he would have included the necessary foreground for the procession, and could then have cut away the unwanted upper part, and made an attractive panel. In such a case it is necessary to foresee what should be done, and act accordingly. It is too late now.

Fig. 3 is a beautiful little print, but if it were mine I should prune down the foreground shingle, which is monotonous in character. A more important reason is that this removal has the effect of bringing the line of boats nearer, and so increases their importance. In this case it might have been well to point the lens up a bit, so as to include more sky, which could then have been retained or removed as seemed best. There are no verticals to suffer. The

Fig. 2.

Fig. 3.

Fig. 4.

camera was not held quite level from side to side, and an unbroken sea-line would have made this obvious.

In Fig. 4 I should not have the slightest hesitation about taking that strip from the top. The regular row of chimneys is irritating, and they, together with the glaring sky, draw the eye away from the pleasant and well-lighted group. Although it is a matter of personal taste, I should not trim the foreground. It is not monotonous like the shingle; it emphasises the idea of the hayfield; and it keeps the group well up in the picture.

The last point has special significance. It is often advisable not to trim away a part of the print simply because it is monotonous and lacking in interest. It may be well

Fig. 5.

to retain it simply because it keeps some other feature in a good position. The group in Fig. 4 is equidistant from the two sides; a trim from the bottom would make it also equidistant from top and bottom; that is, it would be central in the picture space.

In Fig. 5 the ink line has nothing to do with trimming, but is to make clearer the position of the horizon line in the print. It is surprising that the author did not see this glaring defect for himself. If he had, he could easily have trimmed the print so as to put it right. Instead of doing this he enters it for competition, and at a glance the judge would reject it as hopeless.

Trimming a subject at some stage in its production is a matter that cannot safely be ignored; indeed it always demands careful attention.

W. L. F. W.

"The A.P." Monthly Competitions

PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

(I) For Advanced Workers.

This class is open to all amateur photographers.

FIRST PRIZE.—One guinea in cash or "A.P." silver plaque (optional).

SECOND PRIZE.—Half a guinea in cash or "A.P." bronze plaque (optional).

THIRD PRIZE.—Five shillings in cash.

A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

(II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 10×8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

(III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6×4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon (see advertisement pages) the date of which must be

within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communication on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifteenth of the month following the announcement of the awards.

The closing date for the November competition is Tuesday, November 30th, and for the December competition, Friday, December 31st.

MAKING BETTER SNAPSHOTS-25

By DAVID CHARLES.

This article is the twenty-fifth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. A "Landseer lion" photographed in the rain.

Fig. 2. Dry and dusty on a summer day he looks much less impressive.

THERE are plenty of outdoor subjects which can be photographed in even the heaviest rain, and by using extreme technical measures they can be made to produce results quite indistinguishable from fine-weather ones. But the man who is

one of these lions on a dullish summer afternoon a year or two before. I think most people will agree that Fig. 1 is far more expressive and imposing.

Heavy Rain is Best.

But it is the mirror-effect of wet roads and pavements which provides the greatest number of possibilities for picture-making in the rain. The heavier the rain, the better the effect. The reason why heavy rain is better is that it does more than produce just a wetness on the road. The water flows irregularly when there is a lot of it, and so gives more broken reflections.

With a camera of the twin-lens or other waist-level type, it is comparatively easy to keep it sheltered by assuming a slight stoop and holding it inside the open front of one's coat. Those who favour an eye-level type of camera might do well to practise making one-hand shots, so leaving

the lens they may be ignored, for they will do no harm. But more than a very few drops, or the least condensation, should be the signal for retiring to a shelter, where application of the corner of a dry handkerchief will remove most of the moisture. The real trouble is that it is often very difficult to dry the surface completely when the air is cold and wet, and a smeared lens will give infinitely poorer results than one on which rest a couple of clear rain-drops.

Dry the Camera.

Only the very fastest film should be used, and when bright light is shining through the rain, 1/100th at f/4.5 should usually be sufficient exposure for shots in wide and open thoroughfares. But immediately on arriving home all surface moisture should be wiped from the camera, and it should be opened as far as possible and left in a warmish place to complete its drying without delay. Then no harm need be expected.

Fig. 3. Reflections in wet roads and pavements are easy to photograph, but it is best to include a figure or two to give "life."

after pictures knows that every kind of weather brings him possibilities of its own, and he does not attempt to turn one into another.

The effect of rain upon a subject was never more forcibly brought home to me than when I stood in Trafalgar Square one streaming winter's day and noticed the water pouring down a lion's mane. Having a camera with me, I recorded the glistening effect, and later in the day I searched out a negative I had taken of

the other hand free for the umbrella. In either case, two precautions are necessary. One is to keep the lens tilted downwards as much as possible, to avoid drops of rain falling on its front surface. The other is to avoid either the breath or the warmth of the hands getting to the lens, as when setting the shutter. In very cold weather that alone may cause condensation on the glass surface.

If a tiny drop or two of rain get on

Fig. 4. Reflections like these at twilight can be taken with a super-fast lens and slow shutter speed, or (if there is no traffic) with a slower lens and a short time exposure.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Film Music By D. CHARLES OTTLEY.

THE vexed question of selecting suitable accompaniments for silent films is still one that troubles a number of amateurs who aim at giving in the home cinematic shows of a high artistic order. Nine out of every ten letters that the author has received have asked questions regarding suitability of various musical works to certain specified films.

Non-Synchronised Accompaniment.

In the majority of cases a modified radio or radiogramophone is made to take the place of the dual turntable unit used in many theatres, and the obstacles to an exactly fitted accompaniment are too many to overcome. If possible, two turntables should be used, but whether two or only one is available a very great improvement can be effected if suitable music is chosen.

From the vast repertoire of available music it is at times difficult for the non-musical enthusiast to know which records to select, particularly if he is purchasing them with a view to more or less universal suitability to any type of picture.

Much depends upon the amount it is desired to spend in this connection, but, under careful management, quite a modest sum will equip the home cinema with an adequate supply of music for all normal requirements.

Amongst what may be called "universal" mood records comes Rosse's Suite to the "Merchant of Venice." This comprises two preludes, two marches and an intermezzo. A couple of 12-in. discs carry the lot (H.M.V.), well played by an orchestra of repute and excellently recorded by the latest process.

A Versatile Suite.

When we consider that the above themes adequately cover such widely different films as "Casanova," "Oliver Twist," "Karl und Anna," or "Vaudeville," their versatility will be appreciated. To further clarify the analysis it may be said that one prelude is fatalistic and apprehensive, while the other builds up, gradually, to a strong harmonic climax essentially colourful and stimulating. The intermezzo is sentimental and "pretty," while of the marches, one flavours of the barbaric and primitive while the other is festive in the full sense of the word.

For films ranging from "Balaclava" to "New Babylon" (of Soviet origin), Mendelssohn's "Hebrides" and "Ruy Blas" overtures provide practically a full musical score, but should it be desired to further widen the field the inclusion of

Tschaikowsky's "Casse-Noisette" Suite may be a course worth taking. The little pieces comprising this work are so widely different in *tempo* and atmosphere that practically any travel or scenic film, in addition to drama and comedy, can effectively be screened to their accompaniment.

Some Further Suggestions.

An excellent alternative work to the above, or with advantage an *addition* to it, is César Franck's "Symphony in D Minor." Although mainly dramatic, this great work has its lighter moments, fitting it for such films as "Metropolis," "Faust," "The Spy," or, in lighter vein, "Le Moulin Rouge" or "The Little Follies Girl." If to the above are added a couple of discs of Rimsky-Korsakov's "Sadko" or "Scheherazade" our repertoire will extend to Oriental or semi-Oriental films such as "Le Mille d'un Nuit" or any Eastern scenes.

Of the special "effects" records

available it is not proposed to say much here. Any contingency from the crying of a new-born baby to a train-smash can be provided for, and it is for the amateur to decide whether the aesthetic value of such noises justifies the outlay of 5s. per disc.

Records *not* to choose are those carrying such works as "Zampa," "Light Cavalry" or "Poet and Peasant." Everybody knows the tunes, is heartily sick of them, and can associate them either with the bands that play in the parks or the cornet-trombone duettists of the street.

Not too Loud.

Bear in mind when reproducing *any* record for purposes of film accompaniment, to *keep the volume down*. All that is required of harmony is a background, and this only as a stimulus, not to the active thought-train (which is controlled by the film) but rather to the mind subconscious, which should be, and usually is, subservient to it.

In all parts of the country, and even in the neighbourhood of towns, scenes similar to the above are to be secured by the cinematographer in search of topical action subjects that can help in the production of a seasonal or specialised "documentary." This picture was taken on a farm at Wandsworth—within the London area.

Lantern Illuminants

By
H. J. HINE.

"ILLUMINANTS for Lantern" has ever been a fruitful subject for experiment and discussion. In early days the oil lamp in its "two, three or four wick size" gave a good light, but it made the lantern exceedingly hot. Indeed, the huge flat wick burner was of very much the same construction as the burner in an oil cooking-stove. The light was too yellow and the source was too big in area; for to be efficient the illumination in a lantern must come from a very small source; in theory the only useful light is that coming from a point, the centre of focus of the condenser. Reflectors were used to try to save as much as possible of the dissipated light, and all sorts of advice were given on how to get the light whiter. A favourite one was to dissolve camphor balls in the paraffin, but I myself could never see that the camphor balls had made much difference to the colour.

Limelight and Acetylene.

Then came the limelight; but this was rather a professional's outfit, and the first concentrated light for use at home was the acetylene burner. People usually objected to the smell, but all the same it was a very satisfactory illuminant.

Incandescent mantles were the next attempt, and some very beautifully made little methylated spirit lamps with a tiny mantle were put on the market. These gave a wonderfully bright light but the mantles were fragile.

The use of electricity brought a new series of illuminants, and the electric arc vied with the lime as an intensely bright concentrated source of light. It was a long time before the electric incandescent lamp was suitable for a lantern. The image of the spread filament always showed on the screen.

Special Electric Bulbs.

But gradually there came a demand, not from photography, for an incandescent lamp having a small, bunched up, focussable filament. Bulbs for motor car headlamps and for searchlights were made and when redesigned for their new purpose they suited themselves exactly to our projection lanterns.

Wherever the maximum possible light is desired, these special projection lamps must of necessity be chosen, as the source of actual light is so small that, with the aid of a properly designed reflector, a surprisingly large proportion of the total light emitted can be directed, by way of the condenser, to the screen itself.

The smallest filaments are only to be had in the low-voltage bulbs, which is why these are used where the highest light-efficiency is desired. On ordinary electric mains these low-voltage bulbs can only be used with the addition of a resistance or a transformer; the latter, where alternating current is available, is always the better proposition, as it wastes only a negligible amount of energy. Fed through a resistance, a 30-volt bulb on a 230-volt circuit only receives 13 per cent of the energy actually drawn from the mains; the wastage of the remaining 87 per cent is evidenced by the heating up of the resistance.

A Sixpenny Illuminant.

But where the utmost brilliance of image is not required, an ordinary household lamp will serve quite well. They have a spread-out filament and are an inefficient source of light in a lantern; but with a 150-watt lamp you can afford to waste quite a lot of the light and still have enough to give a comfortable picture in a living-room.

It is extraordinary to think that a lamp from the sixpenny household stores is altogether a better lantern illuminant than were the complicated, smelly devices of only a few years ago.

ACTION SUBJECTS for the AMATEUR CINEMATOGRAPHER

FORTHCOMING EVENTS DURING DECEMBER, 1937.

The Amateur Photographer and Cinematographer's Diary of Forthcoming Events.

DATE.	EVENT.	PLACE.	DATE.	EVENT.	PLACE.
Dec. 6-10.	Smithfield Club Cattle Show at Royal Agricultural Hall ..	London.	Dec. 27-28.	Steeplechase Race Meeting ..	Kempton Park.

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, November 30. Rules in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Folkestone C.C. Exhibition of Photography.—Open, October 23-December 4. (A. J. Stewart, 25, Guildhall Street, Folkestone.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Open, October 29-November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

International Salon Oval Table Society, Inc.—Open, November 16-30. (Oval Table Society Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Open, November 15-30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

XIe International Fotosalon "Iris".—Open, January, 1938; last day for prints and entry forms, November 30, 1937. (F. Geeraerts, Bröderodestr, 22, Antwerp, Belgium.)

Preston S.S. (P.S.). Thirteenth Annual Open Photographic Exhibition.—Entry forms, January 7; exhibits,

January 14. (F. Wells, 65, Powis Road, Preston, Lancs.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Aberdeen P.A. International Exhibition of Photographic Art.—Entries, January 15, 1938; open, February 5-26. (Miss Hilda N. Bailey, 63, Watson Street, Aberdeen.)

Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7-12. (T. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21-March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31; open, March 7-12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)

L.M.S. (London) P.S. 13th Annual Exhibition.—Entries, February 1; open, March 7-12. (Hon. Exhibition Secretary, L.M.S. (London) Photographic Society, 1, Euston Square, London, N.W.1.)

Birmingham P.S. 47th Annual Exhibition.—Entry forms, February 3; exhibits, February 5; open, February 26-March 12. (E. H. Bellamy, 20, Waterloo Street, Birmingham, 2.)

City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday, February 7; open, March 7-12, 1938. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23-26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April, 1938. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9-April 2. Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Scottish Photographic Federation 30th Scottish National Salon.—Entries, March 2; open, April 2-16. (Percy H. Cartwright, 52, High Street, Galashiels, Scotland.)

Hackney P.S. 49th Annual Exhibition.—Entries, March 7; open, March 30-April 2, 1938. (Walter Selfe, 9, Fairlight Avenue, Woodford Green, Essex.)

XVIIe Salon International de Photographie de Belgique.—Entries, April 1; open, May-October, 1938. (J. Lejeune, 70, Avenue Van Becelaere, Boitsfort, Brussels, Belgium.)

November 24th, 1937

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, November 24th.

Amateur Cinematographers' Assoc. Public Show.
Battersea Men's Inst. C.C. "With My Camera After Dark." C. W. Hovey.
Bethnal Green C.C. Practical Work.
Birkenhead P.S. "More Modernism." N. Crawshaw.
Birmingham P.S. Holiday Film Competition.
Borough Poly. P.S. "To-night at Eight-Thirty." R. Goodchild.
Brighton and Hove C.C. "Photography with a Modern Miniature Camera."
Carlisle C.C. Beginners' Evening. "Negative Development."
Croydon C.C. "Photographic Memories of London, 1884-1902."
Dennistown C.C. Lecture. Arthur J. Nelson.
G.E. Mechanics Inst. P.S. "Lantern-Slide Making." R. R. Rawkins.
Hall Green P.S. "Cornwall and Lyonesse." F. W. Pilditch.
Handsworth P.S. "Lantern-Slide Making." W. T. Sulfield.
Hinckley and D.P.S. Midland Counties Photographic Federation Prints and Slides.
Ilford P.S. "The Uses of Photographic Apparatus." T. H. Styles.
Leominster P.S. "The Amateur Photographer" Prize Prints.
Letchworth C.C. Practical Photography. Val Mitchell.
Mountain Ash C.C. Competition—"Hands."
Northallerton and D.P. and C.S. Competition—"Genre."
Northamptonshire N.H.S. and F.C. "Home Portraiture." H. E. Cooper.
Partick C.C. G.D.U. Slides and S.P.F. Colour Slides.
Penrith and D.C.C. "Bring Your Failures," and Mrs. Eades will help you.
Pontefract P.S. Demonstration. Lantern-Slide Making.
Rotherham P.S. "A Talk on the Various Types of Printing Papers." S. Bridgen.
Sheffield and Hallamshire P.S. "A Chat on Picture-Making." H. G. Grainger.
South Essex C.C. Print Criticism.
S. Suburban and Catford P.S. "A Moorish Adventure." H. G. Neville.
Stoke-on-Trent Amateur Ciné S. Inst. of Amateur Cinematographers. Films.
Streatham P.S. "Some Tales of Roman Britain." Geoffrey E. Peachey.
Worcestershire C.C. "Demonstration on Enlarging." P. D. Rabjohns.
York P.S. "The Control of Image Tones on Kodak Papers." B. L. Twinn.

Thursday, November 25th.

Accrington C.C. L. & C.P.U. Slides.
Armley and Wortley P.S. "Intensification and Reduction." G. H. Waumsley.
Aston P.S. "Colour Photography with a 16-mm. Ciné Camera." L. J. Dolphin.
Berkhamstead and D.C.C. "Improving the Negative." R. H. Lawton.
Blyth and D.C.C. "Bromoil." H. S. Becke.
Bolton C.C. Criticism of Prints and Slides in Members' Exhibition.
Bromley C.C. Gadgets and Query Evening. D.C.C. Members.
Bury P.S. Episcopascope Demonstration. Members, bring own Prints. W. Peers.
Camberwell C.C. Monthly Competition.
Coatbridge P.A. Dufaycolor Processing. E. C. Shaw.
Darwen P.A. Inter-Club Photographic Prints and Slides.
Greenock C.C. The S.P.F. Portfolio.
Hall Green P.S. Photographic Alliance Slides.
Hampshire House P.S. "A Trip to South America." F. W. Bontor.
Hull P.S. "With Camera and Hide." A. Gilpin.
Keighley and D.P.A. Y.P.U. Trophy Prints.
Kentish Town P.C. Debate: "For and Against the Miniature."
Kinning Park Co-op. C.C. G.D.U. Slides and S.P.F. Colour Slides.
Liverpool A.P.A. "A Quartette on the Continent." Rev. A. V. Woodcock.
Motherwell Y.M.C.A. C.C. "One-man Show" Prints. Wm. Baillie.
Oldham P.S. Demonstration: "Bromesco." W. R. Ashley.
Padiham and D.P.S. "Technique and After-Treatment of Negatives." J. Y. Brown.
Richmond C.C. "Cruising—in Colour." Nelson Clarke.
Runcorn C.C. "Lantern-Slide Making." Mr. Willis Nevitt.
Singer C.C. Outing for Night Photography. J. Fearn.
Smethwick and D.P.S. Practical Evening.
Sunderland P.A. Lantern Lecture: "Kodachrome." A. F. Park.
Tadmorden P.S. Developing and Printing.
Watford C.C. Monthly Competition (Special Subject—Power).
Wimbledon C.C. Portraiture Competition Criticism. H. Yolland Moysie.

Friday, November 26th.

Royal Photographic Society. Exhibition of Kinematography Lectures and Demos.
Bethnal Green C.C. Lecture: "The Lens."
Brighton and Hove C.C. Committee Meeting.
Bristol and W. of England P.S. "Rustic Life and Humour." Dr. H. A. Haberton.
Castleford Y.M.C.A. P.S. "In Europe with a Camera." E. Mercer.
Dartmouth L. and D.S.P.S. "The Amateur Photographer" Prize Slides for 1937.
Harrogate P.S. Members' Evening.
King's Heath and D.P.S. Alliance 1937 Competition Slides.
Leigh Lit. Soc. (Photo. Sec.). "Diffused Photography." W. Whitworth.
Leytonstone and Wanstead C.C. Questions and Answers.
Preston Scientific Society. "Misadventures with a Donkey in Spain."
Southend-on-Sea and D.P.S. "Simple Enlarging." Miss W. E. Crawford.

Saturday, November 27th.

Dennistown C.C. Sale of Work in Wardlaw Church Hall.
Manchester A.P.S. "Further Scottish Wanderings." G. B. Kearey.
Walthamstow and D.P.S. Annual Dinner.

Sunday, November 28th.

Tadmorden P.S. "A Tour in North Wales."

Monday, November 29th.

Birmingham P.S. Inter-Club Competition with Erdington P.S.
Ashington and Hirst P.C. "Correct Development."
Bexley Heath P.S. "Wash in Running Water—1 hour." G. W. L. Carter.
Blackpool and Fylde P.S. "Methods of Mounting." A. Firth and A. V. Mellor.
Bournemouth C.C. "The Cotswolds." Mr. Finnis Attwell.
Bradford P.S. Slide Night. Criticism: R. Ellis.
Brighton and Hove C.C. Instruction Night No. 4: "After-Treatment of Print."
City of L. and Cripplegate P.S. Informal Meeting.
Dewsbury P.S. "Round About Home." A. Keighley.
Erdington and D.P.S. Inter-Club Visit to Birmingham P.S.
Gravesend and D.P.S. "Printing Demonstration." H. S. Wheeler.

Monday, November 29th—(contd.).

Glasgow and W. of Scotland P.A. "Camera Manipulation." J. A. Mactaggart.
Hanley P.S. Monthly Print Competition.
Hornchurch Evening Inst. P.S. Criticism of Exhibition Prints.
Kidderminster and D.P.S. "Round about Worcester, in Natural Colour."
Kingston C.C. "Westminster Abbey." A. J. Mason.
Lancaster P.S. "Finishing the Exhibition Print." Mrs. Madeley.
L.C.C. Staff C.C. "People I have Shot." James Jarché.
Leeds C.C. Haywood Memorial Trophy Competition.
Manchester A.P.S. "The Ciné at Three Zoos: London, Whipsnade and Clifton."
Newcastle (Staffs) and D.C.C. "Some Masterpieces of Photography."
Oldham Equitable P.S. Quarterly Meeting. W. Miller.
Plymouth Inst. Photo. Sec. Lantern Slide Evening.
Shirley S. and L.C. Photo. Sec. "Pictorial Photography and Composition." F. Green.
Southampton C.C. "Gavarnie and Roundabout." T. L. Williams.
South London P.S. "The Gum-Bichromate Process." G. K. Rule.
Southport P.S. "Around the Mersey." L. N. Winder.
Stourbridge Inst. P.S. Review of Exhibition.
Walsall P.S. Ciné Programme (Some in Colour). D. Royce.
Walthamstow and D.P.S. "Compensator Negatives." H. R. Martyn.
Wolverhampton P.S. "Treatment of Negatives."

Tuesday, November 30th.

Royal Photographic Society. "Testing Half-Tone Screens." A. J. Bull.
Ayr P.S. "Art of Delivering Lantern Lectures." J. B. Scott.
Basingstoke C.C. "The Control of Image Tones." J. B. Scott.
Beckenham P.S. Print and Slide Competition. Landscape Prints.
Birmingham P.S. "Some Monumental Etchings in Warwickshire Churches."
Blackpool and Fylde P.S. L. & C.P.U. Prize Prints, 1937.
Bradford Junior P.C. "Germany." D. Shaw.
Cambridge P.C. "Chloro-Bromide Papers." S. Bridgen.
Dunfermline P.A. Scottish Photographic Federation: Slides.
Eastbourne C. and Ciné C. "Lantern-Slide Making." R. H. Rice.
Exeter C.C. Chloro-Bromide Printing, Practical Demonstrations.
Grimsby P.S. The Yorkshire Photographic Union Competition Slides, 1937.
Hackney P.S. "Old and New Fashions and Ideals." R. H. Lawton.
Halifax P.S. Annual House Exhibition. To be opened by P. S. Colledge.
Hampshire House P.S. Beginning of Members' Monthly Competition.
Harrow C.C. "A Tour of Southern Ireland." Miss E. A. Miller.
Hounslow P.S. Lecture by H. T. W. Wray.
Leamington and D.P.S. "A Ciné in Central Europe." S. B. Carter.
Leeds P.S. "Venice." R. P. Haw.
Leicester and Leicestershire P.S. "Hans Andersen's Country—Denmark."
Manchester A.P.S. Exhibition Week. "Alpine Snows." F. A. P. Zacharias.
Monklands P.S. "Dufaycolor Processing." Dr. G. Thomson.
Newcastle and Tyneside P.S. Alliance Slides, 1936.
Newport (Mon.). C.C. Lantern—"A.P." Prize Slides, 1935.
Norwood C.C. "Portraiture." K. Imai.
Nuneaton P.S. "Enlarging." (Practical).
Pontefract P.S. Demonstration: Bromoil Prints. H. Akeroyd, Castleford.
Portsmouth C.C. "Composition." W. J. Bartle.
Preston Scientific Soc. "Uses of a Densitometer." P. S. H. Henry.
Rugby P.S. "Printing and Enlarging." A. V. Scratchley.
Sheffield P.S. "The English House and Castle of the Middle Ages."
Small Heath P.S. "Still Life."
South Shields P.S. "The Romantic Landscapes of Alex. Keighley." F. C. Tilney.
St. Bride P.S. Competition. Club Night.
Stafford P.S. "Soul." J. D. Jones.
Swansea C.C. "Doctoring a Print." Elwyn Thomas.
Swindon and N. Wilts F. and C.C. "Mounting, etc." S. Wheeler.
Warrington P.S. "A.P. and C." Prize Slides.
Winchester P.S. Informal Evening at Winchester College.
Willesden P.S. "Finlay Colour Simplified." J. H. Clark.
Worthing C.C. "Rambles in Sussex." E. Yates.

Wednesday, December 1st.

Battersea Men's Inst. C.C. "Picture-Making with Bromoil." F. H. Martin.
Bethnal Green C.C. "Portraiture." Demonstration and Practice in Club Studio.
Birkenhead P.A. "Natural Treasures from Aladdin's Cave." Dr. C. T. Green.
Birmingham P.S. "Electrical Recordings: Their History and Capabilities."
Birmingham Poly. P.S. Second Slide Competition.
Bradford P.S. "After-Work on Prints and Mounting."
Brighton and Hove C.C. "In Tell's Country." R. H. Lawton.
Carlisle C.C. "Architecture." E. R. Bull.
Cheltenham C.C. "Portraiture." Hugo van Wadenoyen.
Croydon C.C. "Birds of a Feather." J. H. D. Ridley.
Darwen P.A. "From Liverpool to Vancouver." E. S. Maynard.
Dennistown C.C. G.D.U. and S.P.F. Colour Slides.
Edinburgh P.S. "Scottish Portrait Painters, principally Raeburn."
G.E. Mechanics Inst. P.S. "The Constitution of a Developer." S. K. Tweedy.
Handsworth P.S. M.C. and Federation Slides.
Ilford P.S. Print Competition.
Kingston Ciné C. Club Competition Film Judging and Prize Distribution.
Leominster P.S. "Print Finishing." W. Ecclestone.
Letchworth C.C. Lantern Lecture. Photographs from Famous Bird Sanctuaries.
Luton and D.C.C. "Photography with a Modern Miniature." W. G. Briggs.
Manchester A.P.S. "A Rhineland Holiday." W. H. Gleave.
Mountain Ash C.C. "Light and Lenses II." Messrs. Williams and Crate.
Northallerton and D.P. and C.S. "Processing Miniature Negatives." J. Penn.
Partick C.C. Studio Night. Bring Cameras. A. Caldwell.
Scarborough P.S. "The Amateur Photographer" Slides.
Shropshire C.C. "Dufaycolor."
Solihull P.S. "Lantern-Slide Making." J. O. Wilkes.
South Essex C.C. "Table-Top Photography."
S. Suburban and Catford P.S. "With Rucksack and Camera." N. L. Gyspeerd.
Stoke-on-Trent A.C.S. Colour: 8, 9.5, 16 mm., which?
Windlesham C.C. Compass Camera Demonstration.
Worcestershire C.C. "Applications of Cinematography." G. G. Corder.
Yeovil P.S. "Garden Photography." Hugh Seaton.
York P.S. "A Night Out." Bring Cameras and Tripods.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

ECONOMY WITH PHOTOFLOOD LAMPS.

SIR,—Mr. H. A. Markwick is quite right; I am inclined to agree with him that Mr. I. R. S. Leask has never actually constructed the dimming device which he described, otherwise he would never have suggested using so expensive a method as a separate resistance lamp. The makers of Photofloods state that the consumption is 250 watts, so that a 1,000-watt resistance lamp would have to be employed to reduce the consumption of four Photofloods to half the normal consumption (if that is what Mr. Leask means by "half-power"); and 1,000-watt lamps are not cheap.

Actually, of course, the *brilliance* of Photofloods is reduced by very much more than half if the voltage is halved by a resistance; in a very interesting article in the 1937 E.J. Almanac the authors say they found that reducing the voltage by 43 per cent reduced the light to only a quarter of its previous intensity.

By far the simplest and cheapest method is to use a series-parallel switch, so that if four Photofloods are used they should be wired into two groups of two lamps each, the lamps in each group being permanently in parallel with each other, and the switch used to throw one group in parallel with, or in series to, the other group.—Yours, etc., V. P. WILLIAMS.

REPAIRING A LEAKING CAMERA.

SIR,—Here is a hint for repairing camera bellows which I think would be of interest to many of your readers.

A while ago a friend of mine gave me a present of a folding film camera. On developing my first film I was rather annoyed to find that about one-third of the negatives (16 on $3\frac{1}{2} \times 2\frac{1}{4}$ film) were spoiled with patches of fog. I knew that this was not due to carelessness on my part so I set about finding the cause of trouble. At first I thought that there was some internal part of the camera which was reflecting light (this often happens if the lens mount gets scratched and the dull black finish becomes shiny). On examining the camera I found that this was not the case. Then I examined the bellows in daylight, but I could see nothing wrong there. However, I was not satisfied; I knew that light was getting in somewhere. So I got an ordinary table lamp, took off the shade, and put in a 100-watt globe. I then took off the back of the camera, closed the lens, and held the camera over the strong light. Then I saw the reason for the fogged negatives. The corners of the bellows were perforated in about a dozen places; very minute holes they were, and only discovered by turning the camera in different directions over the bright light. Now the next thing was how to repair them. (The camera was not worth the price of new bellows.) Adhesive tape would have

been a "finicky" job. Then I suddenly remembered that I had some solution which I had been using for sticking rubber soles on shoes. This is "black" in colour and costs 3d. per tube. With this and a water-colour brush I gave the corners of the bellows a good thick coat. This dried in a few minutes, and I gave it another coat. I then left the camera open for a few days, to let it dry thoroughly, and found on examining it under the light that it was absolutely light-tight, and the bellows closed without any difficulty. Since then I have not been troubled with fog. So I keep a tube of this solution handy, as these holes are very common in camera bellows.—Yours, etc., DAVID HODGHTON, JUN.

AWARDS OR NO AWARDS?

SIR,—As an executive officer of a photographic society in the North, I should be pleased to have your readers' views as to whether the giving of awards to successful exhibitors at photographic exhibitions is necessary, advisable or desirable.

I understand that some societies have already taken a stand on this point, and I am anxious to know whether the withholding of awards has (a) affected the number of entries; (b) affected the quality and standard of work submitted to exhibitions?

My committee would like to take the plunge, but naturally it is anxious, above all, that the standard of the work submitted should not be reduced.

Further, assuming that the general opinion of readers is that the giving of awards, in the form of silver cups, plaques, etc., is not desirable, would you advise the giving of certificates in the place of the usual awards?—Yours, etc., J. ROBSON BYERS.

CONTACT OR ENLARGEMENT?

SIR,—The enlarging season is upon us. Thousands of mighty prints will be made, and miles of bromide paper used up in the coming weeks. The cult of the miniature and small camera is in the ascendant.

And yet as a photographess of (ahem!) a few years' standing may I plead for the contact print? A good half-plate or whole-plate contact print on normal bromide paper from a suitable negative can be a thing of charm and beauty. I think it was the late Mr. R. Child Bayley who has stated that there is a richness and quality in a correctly processed print made in contact with its negative that is very satisfying.

Let your hefty McGregors of the Leith Camera Club and your muscular Cuthberts from Croydon hug to their bosoms their Baby Sibyls and their Peggys and their Super Sport Dollies, and it please them. For self and others like minded give us the open road, the fell, the glen, the moor, the fen, the crag and the torrent, and "a wind on the heath" together with a half-plate outfit and three double dark slides.

I once saw some portrait photographs signed "Furley Lewis." They were contact prints. I can conceive of nothing better in any form of graphic art.—Yours, etc., DOLLY VARDEN.

"The A.P." Monthly Competitions

AWARDS FOR OCTOBER.

THE competitions for October showed an extraordinary increase in numbers, indicating again that the print-making season has commenced in earnest. It is notable also that a great number of the entries are of the same subjects as those entered in "The A.P." Annual Lantern-Slide Competition which closed last month. It may be assumed from this that many negatives have been reserved by our readers both for the making of lantern slides and prints during the autumn and winter. It is also worth recording that in most cases the lantern slide shows better quality, possibly due to its being a transparency, than the print of the same subject. The standard of merit, however, in all three classes is a high one. The awards are as follows:—

ADVANCED WORKERS' SECTION.

First Prize.—"By the Water's Edge," by P. Walshaw, 37, Avondale Road, Nelson, Lancs.

Second Prize.—"Spring," by G. Bramslev, 150, Gh. Kongevej, Copenhagen, Denmark.

Third Prize.—"On the Roof of the Bathing Pool," by H. Warwick Nevill, 207, Romford Road, E.7.

Mounting Prize.—"Corfe Castle," by Francis E. Jones, Wendwyne, Manchester Road, Tyldesley, Lancs.

Certificates of Merit.—"Taps," by T. B. S. Cox, Three Eldon Road, Cheltenham; "The Doll's House," by A. H. Roche, 53, Loveday Road, Ealing, W.13; "Wrinkles," by A. L. Syed, Palanpur (N.G.), India.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1 and Class 2 respectively.

Those awarded Honourable Mention are as follows: (2) J. H. Clark (London, S.E.); Percy Cox (Manchester); J. F. Cutler (Edgware); (2) G. F. Eales (Plymouth); E. A. Fordham (West Wickham); Peter Hennessy (Newton Abbot); (3) William Jackson (Hull); W. G. Johnston (Glasgow); (2) B. A. Knights (Hayes, Middx.); Miss P. D. Kooka (Borabury); Emile Laevaert (Brussels); (2) Mrs. K. M. Parsons (Reading); W. Rambow (Middlesbrough); S. Salt (Birmingham); Lilian F. Thomas (Liverpool); (2) H. R. Thornton (Birmingham); S. Watson (Beaconsfield, Bucks).

INTERMEDIATE SECTION.

First Prize.—"J. Lever, Esq.," by T. Hodgkinson, 13, Brock Road, Chorley, Lancs.

Second Prize.—"Old Faithful," by Mrs. Stephens, 25, Warwick Road, London, E.5.

Certificates of Merit.—"The Skater," by Arthur Harrop, Cliffe House, Horbury, Yorks; "Bigbury Bay, Devon," by E. H. Holmden, 53, Five Mile Drive, Oxford; "Potential Leader," by The Rev. Arnold Madden, O.S.F.C., Franciscan Priory, Crawley, Sussex; "A Wandering Minstrel," by Mrs. M. Smith, 13, Market Place, Pickering, Yorks.

BEGINNERS' SECTION.

First Prize.—"Joie de Vivre," by D. J. Fraser, 2, Gardiner Road, Blackhill, Edinburgh, 4.

Second Prize.—"Fun," by A. C. Best, 23, Parallel Street, Sliema, Malta.

Certificates of Merit.—"A Hundred Eyes," by F. A. Coghlan, 20, Oxford Street, Eccles, Lancs; "Memory in Stone," by A. J. Fairman, 15, Dorset Road, Mitcham, Surrey; "Admiration," by S. B. Lepper, Park View, Hurston Lane, Storrington, Sussex; "Gipsy Smith," by K. Ronald, Marcol House, 1, Erndale's, 289, Regent Street, London, W.1.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Owing to insufficient addresses being sent with entries we are unable to despatch some of the awards in our last "A.P." Overseas Competition. In some cases the plaques and certificates have been sent and returned to us marked "Gone Away." Will our Colonial readers who have not yet received their plaques and certificates please let us know at once in order that these may be despatched immediately. The prize-winners whose awards we still hold are: Dr. Don Arturo de Carvalho (Bombay), silver plaque returned through post; L. Wilcock Allen (Johannesburg), silver plaque; S. Schulman (Johannesburg), bronze plaque; R. L. Higgins (Brisbane), certificate; and K. H. Stanley (Rawalpindi), certificate.

Our readers are reminded that the Exhibition of Cinematography at the House of the Royal Photographic Society, 35, Russell Square, W.C.1, closes on Saturday, November 27th. Admission is free.

Messrs. Kodak Ltd., Kingsway, London, W.C.2, have just published a booklet entitled "We're Showing the World." This describes the various models of the Kodascope ciné projectors for 8-mm. and 16-mm. film, and gives details of the Kodascope Library from which films can be hired for home projection. The booklet will be sent without charge to any reader who applies for it, in person or by letter, at the above address.

Our readers will learn with regret of the death of Mr. J. J. Butler, the late president of the City of London and Cripplegate Photographic Society, with which he had been associated for over twenty-five years, on November 7th, at the age of 68. He was a member of the Council of the Royal Photographic Society, and will be remembered for his years of active service with the Central Association and various committees.

Mr. Walter Selfe, Hon. Secretary of the Hackney Photographic Society, asks us to announce that he has now moved from his Clapton address, and in future all communications to him should be addressed to 9, Fairlight Avenue, Woodford Green, Essex.

Once again the Annual Exhibition of the Windlesham Camera Club proved an unqualified success. The show was opened by the Hon. Anthony Asquith, and was visited by several hundreds of visitors, including an unexpected visit from the club's patron, H.R.H. the Duke of Connaught. The Hon. Secretary, Mr. J. C. Hayward, of Hallgrove, Bagshot, Surrey, is to be congratulated on his organisation of the show.

Our sister paper *The Autocar* contains in its issue for last week a useful article

for the photographer, entitled "With a Camera at the Races." It deals with the motor racing at Donington Park, and is illustrated by photographs taken by readers of the paper.

Miniature camera users will be interested in a new catalogue of "Miniature Camera Accessories" just published by Messrs. Wallace Heaton Ltd., of 127, New Bond Street, W.1. The catalogue covers accessories (other than enlargers) of all makes, and includes some that cannot be obtained elsewhere. A copy of this interesting publication will be sent without charge to any reader who applies for it at the above address.

The Ilford Photographic Society wishes to draw intending members' attention to the fact that it has no connection with the well-known firm of Ilford Ltd., whose premises are in the same borough. Full particulars of the Society's activities from the Hon. Secretary, Mr. E. Lines, 52, Wingate Road, Ilford, Essex.

The Annual Dinner of the South Suburban and Catford Photographic Society was held at the Comedy Restaurant, Haymarket, on Saturday, November 6th, when over ninety members and guests of various societies were present. The Bromley, Cripplegate and Croydon Clubs were represented, and a

vote of thanks passed to Mr. H. D. Fretwell for the organisation, which included a cabaret entertainment. Mr. G. Herbert Dannatt occupied the chair.

The City Sale & Exchange (1929) Ltd., 59/60, Cheapside, London, E.C.2, have just published a fully illustrated 34-page book dealing solely with enlargers and enlarging accessories. Enlargers of all types, vertical and horizontal, using daylight and artificial light for illumination, and taking all the popular sizes of negatives, are fully described, illustrated and priced. The various accessories include masking devices, exposure meters for bromide enlarging, and strip calculators. An order form is included in each copy of the book, which is obtainable on application from the City Sale and Exchange (1929) Ltd., at the above address.

We hear that Mr. J. Ronald Taylor has retired, after forty-seven years' service with Messrs. Taylor, Taylor and Hobson, Ltd. Mr. Taylor was for many years manager of the firm's New York Office, and since 1921 has acted as Sales Director, during which time he has made many friends, who will miss him, but will wish him good luck in his retirement.

The first weekly prize-winner in the new Wallace Heaton "Figure Studies" competition is Mr. Sidney Phillipson, 57, Redcliffe Road, S.W.10, to whom an award of one guinea has been made for his picture entitled "Oriental." Full particulars of these weekly competitions appear regularly in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ x 3½ x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

101. Makers' Formulæ: Developers for Kosmos Papers—(2)

Vitegas Warm-Tone M.Q.

Metol	..	17½ grs.	(2 grm.)
Sodium sulphite (anhydrous)	..	220 grs.	(25 grm.)
Hydroquinone	..	60 grs.	(7 grm.)
Sodium carbonate (anhydrous)	..	230 grs.	(26 grm.)
Potassium bromide	..	350 grs.	(40 grm.)
Water to	..	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 620 grs. (70 grm.).

Used undiluted at 68° Fahr., this developer gives a brown tone on Vitegas or Vitegas de Luxe, in 1 to 2 minutes.

For colder tones the bromide can be reduced to as little as one-tenth the quantity given. Less exposure will be required.

For the coldest tones Vitegas Amidol developer is recommended.

Vitegas M.Q.

Metol	..	17½ grs.	(2 grm.)
-------	----	----------	----------

Sodium sulphite (anhydrous)

..	132 grs.	(15 grm.)
Hydroquinone	..	50 grs. (5.5 grm.)
Sodium carbonate (anhydrous)	..	185 grs. (21 grm.)
Potassium bromide	..	10 grs. (1.1 grm.)
Water to	..	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 264 grs. (30 grm.). If crystallised carbonate is used, take 500 grs. (57 grm.).

This developer, used undiluted at about 68° Fahr., gives warm black tones on Vitegas.

Vitegas Amidol.

Sodium sulphite (anhydrous)

..	220 grs.	(25 grm.)
Amidol	..	110 grs. (12 grm.)
Potassium bromide	..	14 grs. (1.5 grm.)
Water to	..	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double the quantity shown above.

This developer gives warm black tones on Vitegas and Vitegas de Luxe.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be couched in specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Uneven Illumination.

I have made an enlarger, using a condenser of 4 in. diameter, and though I can get an even illumination when using a small incandescent gas mantle, when I substitute a 24-watt headlamp bulb there are blue and orange patches in the illuminated disc. I have varied the distances between light, condenser, and negative over a wide range without results. W. P. M. (Wallington.)

As you say that you varied the distance between your electric bulb and the condenser, and between the condenser and the projection lens, over a wide range, and still have failed to obtain even illumination, we can only conclude either that these three have not got their centres in an exactly straight line, or else that the condenser is not exactly at right angles to this line.

You may find the adjustment difficult to make even with this hint as to the probable cause of your difficulty, and we suggest that your best plan will probably be to use a diffusing screen, which will make the adjustment very much less critical.

Baskett's Reducer.

I have mislaid my copy of the formula for Baskett's Reducer. Although you have published it many times, could you possibly repeat the formula once again? M. C. (Windsor.)

The formula for "Baskett's Reducer" is given in "The Amateur Photographer" Diary, as follows:—

Ordinary terebine	2 oz.
Salad oil	2 oz.
Globe metal polish (paste)	2 oz.

Mix thoroughly and strain through muslin. A little is applied with a pad of cotton-wool and rubbed firmly on the part requiring reduction. The negative—either plate or film—must be placed on a flat surface, or it may get broken or damaged from the pressure applied. This is excellent for local reduction and for cleansing surface markings from negatives.

Stagnant Developer.

I enclose a print in which streamers of light issue from dark objects and spread upwards across the sky. The effect is seen in the negative, too; can you account for it? W. B. (Belfast.)

The phenomenon shown in your print is not an unusual one, but only occurs in certain circumstances, one being that the developer was left stagnant for considerable periods. The result is often seen, too, in the case of tank development, where the negatives are left in the same position and the developer allowed to remain still.

In the print you send the light edge round the post, for example, is caused in the following manner: the solution acting on the sky becomes overworked and exhausted; that on the post has no work to do at all, and this active developer diffuses out into the surrounding gelatine and continues its action there; hence the greater density. If you turn the print upside-down you will see how developer from the dark head of the figure will diffuse downwards into the sky. We hope this has made the matter reasonably clear.

Night Photography.

Can you recommend to me a book on night photography, indoors and out, by artificial light? I am very hazy about how it is done, and the kind of exposure to give. C. McC. (Ireland.)

We should recommend you to obtain "Taking Pictures at Night," by Dr. Kross, published in this country by Messrs. Sands Hunter & Co., Ltd., 37, Bedford Street, Strand, W.C.2. A fuller edition in German can be obtained from Wilhelm Knapp, Halle, Saale, Germany. Either of these books will give you a very considerable amount of information on the subject, but we would also draw your attention to the various articles on this topic published from time to time in our pages.

Photo-Cell Meter and Filters.

If a filter were placed over the lens of a photo-electric meter would the meter then show the correct exposure to give when using the filter on the camera? G. P. L. (Brazil.)

Your suggested method of estimating filter factors—for this is what your proposal really amounts to—would only be correct if the photo-cell and the emulsion had exactly the same relative sensitivity to different colours. Emulsions differ so widely in their relative colour-sensitivity that the filter factor found by putting the filter over the lens of the meter could not possibly be correct for all of them. But as a means of getting a rough estimate of the factor of an unknown filter your suggestion has its value; probably the figure so found would be somewhere near correct for a panchromatic emulsion.

Stale Paper.

Can you suggest a cause for the grey mottling at the edges of the enclosed print, which was developed in a standard M.Q. developer? Is it due to the gaslight paper being old, or is the developer faulty, or have I left the print in it too long? C. M. (London.)

Although we cannot say for certain, we should say that the trouble with your print is due to deterioration of the paper due to age or improper storage. You could probably, however, use it for smaller prints, so that you could cut off the fogged margin. If the mottling only develops up just before the print goes into the hypo, you may perhaps get satisfactory prints by increasing your exposures a little—not more than 25 per cent, and less if it is an extra-vigorous paper—and cutting development just a little short. This is worth trying, but you may find it spoils the colour and quality of the prints.

Enlarging from Sub-standard Film.

I am going to make some enlarged negatives from 16-mm. film, using a "Filmo" projector (750-watt lamp) as enlarger. Please tell me what plate and developer to use, what exposure to give, how long it will be before the image appears in the developer, and the total time to develop. H. I. B. (Kew.)

For making your enlargements we would suggest that you use a slow ordinary plate of any well-known make. Perfectly satisfactory results will be obtainable with almost any developer. The length of time which elapses before the image appears will depend upon the make of plate, the amount of exposure it has received, the developer you use, and the temperature at which you work, and we therefore cannot possibly give you any figures in this connection, nor can we give you any figures for exposure times. These you will have to determine for yourself by experiment.

Marks on Negative.

What is the cause of the coarse grain or developer marks on the enclosed film? And can I remove them in any way? R. J. C. (London.)

We do not see anything on your negative that can be described as coarse grain. The streaks on the back are due to not swabbing the film before putting it up to dry. If you re-soak it for some time, you may be able to remove the marks by rubbing them under water with a plug of cotton-wool.

WE ARE LISTENING

as we write to John Watt's commentary on the Royal Command Performance at the London Palladium, and, as we listen, we cannot but wonder how many of the cameras we have sold are being used in and around the theatre to-night.

When, in the distant past, our first prominent press customer came to us, we puffed out our chest with pride; when he recommended us to his friends, our waistcoat buttons sprayed "202" like a Tommy-gun. And now, as we review the number of famous newsmen whose cameras have known our shop, we feel that our pride is justifiable, since we must have given photography's most critical buyers satisfaction for them to now be regular "202"-ers.

Don't do what the famous do just because the famous do it—miniaturists are too individual for that, anyway—but we would suggest that you discover why they come to us, and, to that end, we urge you to "Try 202 for Service!"

MONEY, MONEY, MONEY

is a curse, curse, curse! At any rate we thought so when we were struggling to make our name, before ever "202" was thought of.

And we, just like some of our readers nowadays, were too proud to stoop to hire-purchase. If we had only known then what we know now, how soon our false pride would have been dispelled!

Don't let *amour-propre* stand in the way of your advancement in miniaturism—take advantage of our hire-purchase arrangements, and use the apparatus best suited to your needs.

MINIATURE NEWS AND TIPS DEPARTMENT.

TIP FOR THE WEEK.—This will interest mainly those using the following: Leica, Retina, Dollina, Kine-Exakta, Virgini, Weltini, Baldina and Beira. You probably often feel the need for a reloadable cassette at a low cost. We admit that it seems an unnecessary waste to pay 1s. 6d. each time for a patronne that is only thrown away when the film is developed, and have often wondered whether all of our customers are fully alive to the convenience of the reloadable Mimosa patronnes. These cost 3s. 6d. loaded with Mimosa film, or 2s. 9d. empty, and loading with any make of film, in any length up to the standard roll of 36 exposures, is very easily carried out. The saving of 1s. 6d. per film soon pays for this very useful cartridge.

NEWS OF THE WEEK.—There is on the market in France an article called the Summor winder. It is not available here just yet, but we thought a few details might interest you. This very compact accessory holds a 10-metre strip of film (over 30 ft.), which is used up as required. The end of the film is fixed in the usual way to your centre spool (all modern cassettes being usable) and the body of the cassette is slid on to the winder. A handle is then turned while an indicator shows the number of exposures being wound on. When the required number is loaded (anything up to 36) the film is cut and the cassette taken out, the whole operation having taken place in broad daylight. There is no need for us to dilate on the virtues of this article, as you will all undoubtedly read about it in next month's M.C.V.

STOP PRESS.—As our copy was being folded before being sent to "The A.P.," we received the very latest Zeiss Contax wide-angle lens into stock. This is the 3.5-cm. f/4.5 Orthometar, which costs £18. We can't tell you whether it's good or otherwise this week, as we haven't had time to test it yet, but Zeiss have never let us down yet. Will let you know the results next week. That's all.

A GUARANTEE,

when issued by a firm that prides itself on its straightforward and honourable dealing, gives a feeling of security to the purchaser that it would be difficult to put into words. All miniature apparatus sold by us is guaranteed against any defect whatever for one year from date of purchase, and indefinitely after the expiration of that period against any inherent defect. So, when buying your next camera, why not "Buy 'Lewis' and Buy Safe!"

SPECIAL WIDE-APERTURE LEICAS FOR WINTER PHOTOGRAPHY

Leica IIIa, f/1.5 Xenon. As new.	£47 10 0
Leica IIIa, fitted latest f/1.9 Hektor. As new	£41 15 0

NEW Rhaco DIFFUSION DISC

A new model of the "Rhaco"
 Diffusion Disc conveniently
 mounted for use with vertical
 enlargers. When held im-
 mediately below the lens of
 the enlarger a soft-focus effect
 will be obtained on the
 resulting enlargement.

The "Rhaco" Diffusion Disc is supplied in two sizes, mounted as illustrated.

Model I, size of lens $1\frac{1}{2}$ in. diameter	16/3
Model II, size of lens 2 in. diameter	21/3

Obtainable through your dealer.

—he will gladly demonstrate their capabilities—Tempiphot, the amazing photo-electric meter ; Exakt, the professional enlarger at an amateur's price.

AMATEURS!—You must get the enlarger that the trade-workers use "EXAKT"

With simple, speedy, automatic focussing.

A single enlargement, or the biggest batch of work can be turned out with exceptional speed, owing to its simple manipulation and perfect construction. The f/4.5 three-cell Steinheil Cassar enlarging lens works smoothly on its spiral mount. A turn of the focussing ring is all that is required to get dead accurate focussing. The "Exakt" is built of solid, reliable, cast metal, and will give years of good service. MADE IN 3 SIZES. FOR ENLARGING FROM ALL SIZES OF MINIATURE NEGATIVES and $3\frac{1}{2} \times 2\frac{1}{2}$ in. at prices from

A FAMILY OF MINICAMS AT LOWER PRICES

—in fact one of the best families in the camera world. Look at the specification, then remember that a VAUXHALL, whichever model you choose, costs at least 40 per cent. less than other cameras of a similar type. The f/2.9 anastigmat lens makes the VAUXHALL MINICAM ideal for winter landscapes, indoor shots and night scenes. Make your album as distinguished as a gem among pebbles!

Specification.

Delayed action, remote control shutter release, self-erecting rigid front, lever-operated radial focussing, hinged back, strut for time exposures, coupled range-finder with optical tubular view-finder on de luxe model. Real leather bellows, all-metal body, finest leather (morocco) covering. Takes 12 pictures 2 1/2 in. square or 16 2 1/4×1 1/4 in. on standard 3 1/4×2 1/4 in. film. High quality f/2.9 anastigmat lens, Compur or Prontor D.A. shutter.

PRICES:

With coupled range-finder, etc., and f/2.9 anastigmat lens.....	£11:15:0
Without range finder, but with micrometer focussing mount, D.A. Compur shutter, unique radial focussing.....	£7:19:6
Ditto, without radial focussing.....	£6:19:6
Ditto, with Prontor D.A. shutter.....	£5:19:6
Or 12 monthly payments of 20/7, 14/-, 12/3, 10/6 respectively. SELF-FINANCED HIRE PURCHASE TERMS.	

AGFA NEW MOVEX 8 Super 8-mm. Camera. A GENUINE ADVANCE IN CINÉ CAMERA VALUE

The new small flat ciné camera, easily carried in the pocket. Constructed of matt black aluminium alloy. Metal parts chromium-plated. F/2.8 Agfa Kine anastigmat lens. Focussing unnecessary, large depth of focus. Lens hood in lens mount. Newton viewfinder. Powerful motor. Exposure guide on camera. Cassette loading, 33-ft. film (price 6/9 including processing). Price..... **£12:12:0**

Ever-ready Case.....18s. 0d.

Or on our Self-financed Hire Purchase Terms.

AMAZING SCREEN VALUE

An entirely new type of glass-beaded screen far superior in quality to anything at anywhere near the price. Extra strong material, double coating of glass beads which do not rub off. With stretchers and leather carrying handle.

Prices: 30×40, 35/-; 52×40, 47/6

Postage 1/3 extra. Complete in neat cardboard box.

PERSONAL

SERVICE...

WE PUT THE
BEST WITHIN
YOUR REACH

We have the easiest and most confidential plan of payments in Britain. We make every transaction as "plain sailing" as it possibly can be, and the man who has hitherto had to manage with mediocre apparatus can now have the best. We give two years to pay for goods costing £10 or more, 15 months to pay for goods between £5 and £10, and 9 months for goods between 50/- and £5. First payment secures the goods.

A Personal Message
from
Wallace Heaton.

"I have lately returned from a holiday on the Continent where I was able to combine business with pleasure. I made it my business to study the methods of some of the leading Continental photographic dealers and found that the 'personal touch' was very much in evidence. Now I have always advocated and pursued this policy, but I am now determined to intensify it. It will mean a lot more work, but I do not mind that as I am convinced it will give greater satisfaction. That is, and always has been, my chief concern. This message, then, is an open invitation to every amateur photographer and cinematographer to write to me when they want any kind of help or advice in connection with their bobbies. I, personally, will supervise every enquiry, and I hope to keep in touch with you all with frequent important personal messages in my advertisements. Will you look out for them, and write to me as often as possible."

Wallace Heaton

OUR STOCKS
ARE THE BEST
IN BRITAIN

They include Minicams, Enlargers, Home Talkies and Home Movies by every known maker. We also stock every accessory available for every instrument we sell. Ours is the largest organisation of its kind in the country—our staffs are expert, they can use the apparatus they sell, and are in the enviable position of being able to give expert and impartial advice as to choice.

ADVICE AND DEMONSTRATIONS

We have the finest model theatre where latest movies and talkies can be seen and heard, and first-class demonstration rooms where the merits of our apparatus can be compared. There's always a courteous expert to guide you.

PICTURE MAKING AT HOME...

Taken on Selo Hypersensitive Panchromatic Roll Film. Exposure $\frac{1}{25}$ sec. at F/3.8, with one Selo Lighting Set

Winter evenings now offer you further photographic attractions than making enlargements or pasting summer snaps in your albums. Keep your camera busy—taking intimate fireside groups and homely little incidents. They will form such a treasure house of happy memories for you in years to come. Night snaps, indoors and out, are as “easy as daylight”. Just load your camera with Selo Hypersensitive Panchromatic Roll Film or Ilford Hypersensitive Panchromatic Plates. There is no more fascinating way of making perfect “night” pictures.

& CINEMATOPHOTOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXXIV.

Wednesday, December 1st, 1937.

No. 2560.

THIS Rolleiflex PICTURE

—is a beautiful study which provides a further example of how easily such pictures can be secured by the aid of the special features of this unique camera—the ground-glass screen showing the picture full size and right way—the large f/2.8 finder lens making the screen picture still more brilliant—the improved eye-level viewing device—the automatic film-wind which in one action sets the shutter, prevents double or blank exposures, and sets the built-in self-timer for delayed-action (if desired)—and the automatic film register eliminating use of red window. The automatic Rolleiflex also has f/3.5 Zeiss Tessar taking lens and Compur Rapid shutter speeded to 1/500th sec. and bulb. Its extreme versatility, too, is exceptional—normally taking 12 pictures on 3½ x 2½ roll film for 1/-, it can be adapted for plates or 35-mm. miniature films. £31 5 0

Ask your dealer to demonstrate or write for Rolleiflex/Rolleicord brochure and name of nearest stockist from the Sole Importers :

KODAK

NEWS

The Other Half of the Story

So far as materials go, the right Film and the right Paper are only half the photographic story. The right Chemicals are as important.

The ease and rapidity with which you can carry out your darkroom operations, the quality of your negatives, and the permanence of your prints, are all affected by the kind of Chemicals you use.

Specify "Kodak Tested" and you're safe. The accurately compounded Kodak Developers, Fixers, Toners, etc., available from your Kodak Dealer are as pure and uniform and photographically efficient as highly qualified chemists and the resources of the magnificent new Kodak research laboratories can make them.

KODAK LIMITED
KODAK HOUSE, KINGSWAY, LONDON, W.C.2

"MAKE A SHOT" FOR A GOOD CASH PRIZE FOR 'SPEED and ACTION PICTURES'

Golfing pictures, ice hockey, football, motor racing—or the Coronation Express at full speed. It is not difficult to find appropriate pictures for this interesting photographic competition. All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA OR MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd. without further payment.

Prizes are 21/- each week and 6 Certificates of Merit.

Last week's prize-winner: FRITZ BORST, 'Schönbach, b. Eger, with picture entitled, "HILDEGARD," in "Indoor Portraits and Figure Studies."

Address your entries to "Speed and Action Pictures" Competition,

WALLACE HEATON LTD.
127, NEW BOND STREET, LONDON, W.1

£25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry.

A selection of the best entries will be held back at the close of the competition for exhibiting in our galleries prior to their return.

The current series of competitions ends on Dec. 31st—all entries for "Speed and Action Pictures" are eligible for weekly prizes as well as the final £25 prize. All entries for previous subjects in the present series can now only go forward for the final judging for the £25 award.

As simple as adding one to one, and as certain of the correct result.

ROBOT

"THE CAMERA THAT THINKS FOR YOU"

★ This illustration is Full Size

SNOW SCENES · TABLE TOP PORTRAITURE · NIGHT AND CANDID WORK—it's all the same to the 'ROBOT'

THREE MODELS. (Interchangeable lenses).

With Zeiss Tessar f/2.8—3 cm.	£23	10	0
With Zeiss Tessar f/3.5—3 cm.	£29	10	0
With Meyer Primotar f/5.5—5 cm.	£28	10	0
With Meyer Primotar f/5.5—5 cm.	£10	0	0

- Shoots sequence pictures with machine-gun speed.
- Lens always in "ready" position — no withdrawing necessary.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and superseded rangefinders.
- Takes up to 50 exposures on Standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan." to colour film at any moment.
- With motor wound takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives "Time" and from 1 to 1/500th sec.—and all intermediate speeds.
- Weights 14 oz.—just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½ x 2½ x 2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight-loading spools available.
- Camera has stainless steel body, covered black morocco.

'ROBOT' (H. E. J. Spearman, Sole Concessionaire for Great Britain and the I.F.S.)

At this time o' year!

More than ever before, picture-making goes merrily on thro' the winter—and you're no longer confined to daylight. The modern camera, with modern lenses and ultra-fast films and plates, gives you service and pleasure all the year round, indoors as well as outdoors—morning, noon and night. And the exceptional facilities afforded by the WESTMINSTER OUT-OF-INCOME and EXCHANGE plans render the purchase of a modern camera of the very best type an easy and simple matter. This applies, of course, to ciné apparatus as well as "still."

Ask for prospectus.

● The House for LEICAS All Models and Accessories.

New PATHESCOPE 9.5 Projectors

'S'—for 300 or 800 ft. reels

Built of high-quality die castings, ultra-smooth running motor, sprocket fed, motor rewind. High intensity low voltage lighting ensures superb brilliance of picture, with economical current consumption, whilst projection is remarkably free from flicker.

Super cooled lamp-house and separate pilot lamp provided. Gives performance of full theatre standard in your own home.

For all voltages 110/250.

£30

12 monthly payments of 52/6, 24 of 26/3.

'H'—for real Home Movies'

For the projection of 30-ft., 60-ft., 200-ft. and 300-ft. reels. Solidly built. For use on all Alternating Current mains from 200 to 250 volts, 40-60 cycles. Motor-driven through a transformer in the base. Sprocket fed, ensuring steady, correctly centred pictures, with direct and brilliant screen illumination from a 100-watt lamp; semi-automatic shutter for film protection during threading.

£10:10:0
12 monthly payments of 18/5.

SUPER BALDINA New Model

A new and improved addition to a highly popular range of cameras, taking 36 pictures on standard 35-mm. film. Chromium finish, and shutter released from body. Special helical focussing movement down to 3½ ft., parallax corrected finder. With f/2.9 Meyer Trioplan in Compur shutter, 1 to 1/300th sec., T. & B.

£14:10:0 12 monthly payments of 25/5, 24 of 12/9.

Important to HOME CINÉ enthusiasts

To have a good screen is more than half the battle. For pictures of the utmost brilliance, use

The "WESTEX CRYSTAL" Screen

Prices from 27/6 up, complete.

Not only is the cost appreciably lower—but the "WESTEX CRYSTAL" (obtainable only from the WESTMINSTER) is definitely a better screen.

● Remarkable new MULTIFAX Enlarger

Full of attractive practical features. For instance: Exceptionally smooth raising and lowering by friction gear, with triangulated main column, giving maximum rigidity.

Usable either vertically or horizontally at will. Readily adaptable for dealing with enlargements of extra size.

F/4.5 lens and DOUBLE condenser are both interchangeable, and there is simple provision for correction of perspective.

Adjustable lamp-holder ensures highest degree of even illumination, whilst the unique automatic action of the strip negative carrier sets a new standard in simplicity and efficiency. Adaptable for all sizes 24×36 mm. to 6×6 cm.

PRICES:

3½ × 2½ **£16:16:0**

12 monthly payments of 29/-.

2½ square. **£15:15:0**

12 monthly payments of 27/-.

ROLLEICORD Ia

New Popular Model

A high-grade camera with "a name behind it," offering all the advantages of the twin-lens design at a most attractive price. Gives the usual Rolleicord picture 2½ square (12 on normal 3½ × 2½ spool), and comprises most of the noted Rolleicord features. With f/4.5 Zeiss Triotar anastigmat, Compur shutter, 1 to 1/300th sec., T. and B., automatic film winding, metal body with leatherette covering.

£12:10:0

12 monthly payments of 21/11, 24 of 11/-.

BALDAXETTE Model II

Popular Square Picture.

Takes 12 pictures 2½ × 2½ on standard 120 films.

Specification:

F/2.8 Xenar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. Built-in range-finder.

Complete in box as received from makers. List £18 18s.

Westminster's Price

£13:15:0

12 monthly payments of 24/1, 24 of 12/1.

INVALUABLE... to beginner and expert!

Every photographer should have a copy of this up-to-the-minute "Granville Guide." Not only does it contain a complete list of materials, including many new lines, but also full working instructions, formulæ and useful articles written by experts. And the Granville products described ensure perfect results with the minimum effort, whether used by the beginner or the skilled worker. Post coupon to-day to Publishing Department for your free copy of the "Granville Guide." You will also receive a free voucher worth 6d. to 3/-.

LONDON SHOWROOMS: 13, GRAY'S INN ROAD. Telephone: HOLBORN 568d.

A free copy of this splendid publication plus a voucher worth 6d. to 3/- if you post the coupon below

Every keen Camera User should
be sure to get

The AMATEUR PHOTOGRAPHER DIARY

and Handbook for 1938

This useful little handbook contains in addition to the usual diary pages—one week to the page—over fifty pages of facts and formulæ for the keen camera user. Information is given on developing, fixing baths, mountants, and finishing negatives and prints. Numerous reference tables dealing with hyperfocal distances, enlarging, screen distances for lantern projection and exposures are included, as well as sections for exposure records and personal memoranda.

Size 3½ x 5½ inches, well printed, neatly and strongly bound in leather cloth, with back loop pencil and round corners.

Illustration shows G.3 Projector and Model "H" Cine Camera.

THE GIFT THAT ALWAYS MAKES A GOOD "SHOWING"

It doesn't matter whether you are looking for a gift for yourself or somebody else—for the really critical ciné user who wants professional performance and scope Paillard-Bolex apparatus is the best choice.

The Model G.3, for instance, shows 8-mm., 9.5-mm. and 16-mm. films, with a consequent wider choice of films from libraries. This is a super high power projector, with a specification and performance which is the equal of the most costly home movie apparatus obtainable. Price with 500-watt lamp and resistance, £52 10 0.

Then there is the Paillard Model H Ciné Camera, which is a compact and easily handled instrument yet has the fine performance and refinement usually associated with professional apparatus.

It has the biggest range of ciné refinements ever before incorporated in one sub-standard ciné camera including turret head of special design, saving bulk yet taking three wide-spaced lenses, critical visual focuser, self-loading semi-automatic threading mechanism, and a host of other refinements enabling all the professional trick effects to be copied, such as reverse filming, superimpositions, lap dissolves, etc.

This fine instrument is in quite a different class from the usual "mass produced" apparatus and gives the finest technical results both for monochrome and colour films.

Made in three models for 9.5-mm., 16-mm. and double-8 film. Price with Dallmeyer f/1.5 Speed anastigmat lens, £55.

AT LAST!

The "NOVOREX" is here

THE NEW ALL-BRITISH PRECISION ENLARGER

AT A COMPETITIVE PRICE!

SOME TIME ago we conceived the idea that a BRITISH-MADE precision enlarger would appeal to all amateurs, and the result of our numerous experiments is the "NOVOREX." While adhering to proved principles it also embodies the collective ideas of many of our valued customers, and, though simple in design, its attractive appearance and perfect performance will satisfy the most fastidious.

Obtainable only from the Manufacturers :

Adjustable masking frame, 12 x 10 in., 27s. 6d.
" " " 10 x 8 in. 22s. 6d.

Do you know what this is ?

The illustration shows the wheel for operating the combined distance meter and view-finder of the Contax Models II and III when using lenses of 2 in. focal length. Unless the object it is desired to photograph is correctly focussed, two images appear in the finder. By rotating the operating wheel these two images can be quickly superimposed when the focus will be perfectly correct. Moreover, the two images in the distance meter being in complementary colours when fused together appear in almost natural colour. The combination of the view-finder and distance meter images in one eyepiece makes for speed and ease in manipulation, and at the same time gives a much wider angle for focussing purposes than is the case with systems employing separate view-finder and distance meter.

The lever adjacent to the focussing wheel is the stopping arrangement for infinity focus. It is depressed when making an observation in the distance meter for near objects.

Other Contax exclusive features are—choice of 15 interchangeable Zeiss lenses ; incorrodible metal focal-plane shutter speeded to a real 1/1,250th second, and delayed-action release ; detachable back for easy cleaning and loading and many other features.

CONTAX

The Contax is fully described in the 96-page book "Contax Photography". Write for a free copy, or ask your dealer for a demonstration.

VOL. LXXXIV. No. 2560.

If any further evidence were needed to demonstrate that amateur photography has ceased to be a seasonal hobby our Christmas Number, which will be published next week, will supply it. Each winter season in recent years has shown an increasing amount of photographic work being done, and the flowing tide of "miniature" activity is not likely to be affected by mere dull days and long evenings. Such incidents of the calendar only serve to put the modern amateur on his mettle, and armed with super pan. films and large-aperture lenses he delights in tackling the subjects that were denied him not so long ago. In addition to many articles of topical interest and value "The A.P." Christmas Number will also contain a specially prepared "Buyers' Guide" for that large number of readers who are wisely contemplating the purchase of photographic apparatus, materials or accessories as Christmas Gifts for friends who are photographers or who ought to be. A marked copy sent to such a friend will also have its uses. In any case, a few extra copies ordered in advance of next Wednesday is advocated.

Prediction.

The R.P.S. lecture room was crowded with cinematograph apparatus the other evening, and half the time was devoted to sub-standard introductions, and the other half to professional. The firms putting out professional apparatus each showed their own, but the sub-standard introductions were so numerous that if each manufacturer had been allowed to demonstrate, it would have been to-morrow morning before the professional fellows got their turn. Therefore it was

TOPICS of the Week

FOG IN THE CITY.

An article on "Fog-days of Winter and the Camera" will be found on another page in this issue.

arranged that the secretary of the Group, Mr. Sewell, should introduce the whole lot, and this he did very ably. His predictions were interesting. The future of sub-standard

work, he said, would show further developments towards simplification not only of devices for measuring exposure and taking pictures, but also for projection. The early motor cars followed the practice of the horse-drawn carriage, though nowadays the motor car had become something very different. The amateur cinematograph had begun by accepting the conventions or necessities of professional entertainment, whereby in the public cinemas the machine at one end of the hall projected pictures on to a screen at the other. It was the same in the home, and when the pictures were shown, the arrangement of the room had to be upset, the fire shielded, and so on. Mr. Sewell imagined the day when the home film talkie projector would be a self-contained thing, and it would be as easy to operate a reel of film as to put a record on the gramophone. Moreover, under the influence of television we should abandon the present urge for large projected pictures, and be content with something which did not spread itself so awkwardly and at the same time gave a "seeable" result. The instrument used in sub-standard cinematography would be so trouble-free that a large army of new devotees who at present thought the hobby a little too troublesome to be worth worrying about would be recruited. Well, prophecies more unlikely have been fulfilled.

Something like an Enlargement.

An interesting part which photography plays in film production is to provide the backing behind windows seen in the film. Photography is now most often relied on for this purpose, and we are told that in the production "Autumn

Crocus" a photographic backing was used for this purpose which was 150 ft. long and 25 ft. high, and it was enlarged from a negative exposed in a Leica camera. The first photographic backing in an English film production was used in 1931. There are scenes, of course, where a still photograph would not be suitable as a backing. For example, if the scene is laid in a waiting-room at a railway station it would never do to have a "still" scene represented on the platform on the other side of the window. Here an animate backing is necessary.

Camera-man Last.

A newspaper has lately had to apologise to a lady for stating that her husbands had included a dentist, lawyer, merchant, newspaper-man, actor and camera-man, explaining that the lady had never married, but that her choice of husbands would be dentist, lawyer, merchant, newspaper-man, actor and camera-man, in that order. It is a flattering unctious to lay to the photographer's soul that the camera-man should be the last of the six, because, presumably, having got him, she wanted no more. She might have

carried the number on to the Biblical seven, but the sixth was no doubt in all points satisfactory. Perhaps it was intended that he should survive her.

Double Exposure.

The "stills" outside picture palaces are often worth studying. One that we noticed the other day was worth studying for its trick. A couple were seen to be presumably dancing on the keys of a typewriter, their steps causing some writing to appear on the sheet above. A very neat idea.

"The Amateur Photographer" EXPOSURE TABLE—December

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 9 to 10 a.m. or from 2 to 3 p.m. double these exposures. From 8.30 to 9 a.m. or from 3 to 3.30 p.m., give treble or more.

SUBJECT.	Ultra-Rapid.	Extra-Rapid.	Rapid.	Medium.	Ordinary.	Slow and Process.
Open seascapes and cloud studies ..	1/250 sec.	1/150 sec.	1/100 sec.	1/50 sec.	1/25 sec.	1/15 sec.
Open landscapes and snow scenes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/150 "	1/75 "	1/50 "	1/25 "	1/15 "	1/8 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes ..	1/75 "	1/50 "	1/25 "	1/15 "	1/8 "	1/4 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes	1/50 "	1/25 "	1/10 "	1/8 "	1/4 "	1/2 "
Buildings or trees occupying greater portion of picture ..	1/15 "	1/8 "	1/4 "	1/2 "	1 "	2 secs.
Portraits or groups taken out of doors, not too much shut in by buildings ..	1/8 "	1/4 "	1/2 "	1 "	2 secs.	4 "
Portraits in well-lighted room, light surroundings, big window, white reflector	1/2 "	1 "	1 1/2 "	3 secs.	6 "	10 "

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above.

Photography for the Winter Evenings

The essential value of a hobby is that it can be practised

at any time the enthusiast may desire. Photography has that virtue, inasmuch as the long dark evenings will not prove an obstacle to the keen amateur who wishes to continue with his work, but will encourage him to experiment along new lines.

THE keen amateur photographer will want to continue his work throughout the winter months, especially during the long evenings. Of course, table-top work, indoor portraiture, theatre photography and night subjects will come as a matter of routine to the worker with the ultra-fast miniature, but the owner of a modest outfit may feel that he is a little out of things, and long for the bright days again when he can go out and capture happy snapshots in the country or at the seaside.

Simple Work.

But so long as the limitations of the outfit are known, and considered carefully before any work is undertaken, all sorts of actual camera work are possible to the enterprising amateur. Even indoor portraiture is possible with a box camera, provided you have a subject that will keep still, and has every assistance in doing so. For successful work of this sort comfort is of prime importance. If the model is comfortably seated and engaged in some familiar occupation such as reading, if a man, or knitting, if a woman, it is surprising how long an exposure can be given without signs of movement. If flashlight is used the matter becomes still more simple.

Let your subject get settled down, arrange the lighting and "taking" position without consulting him at all, then say, "Just keep still for a few seconds," and fire your flash or give the long exposure.

Table-top work is simple enough with any kind of camera, and it is probably one of the most popular forms of indoor photography practised during the winter months. As much of it is of the "close-up" variety, it may be necessary to employ a supplementary lens if the camera lacks the necessary extension.

Lighting.

For table-top work all sorts of lighting can be used, even to a couple of humble candles arranged in home-made reflectors. The exposure will be long, it is true, but if everything is absolutely still no anxiety need be felt. Electric cycle lamps, especially those of the type which have a dim and bright switch, are very useful for

this kind of work, using the bright of one lamp to give the main lighting, and the dim of another to give the auxiliary light. Even a swan-neck burner such as is used in gaslight enlargers is useful for varying lighting effects, and the enthusiast will soon be rigging up all sorts of queer contraptions to get the results he desires.

Other Work.

The long evenings also provide an excuse for processing work of all kinds, and the amateur photographer will not have to look very far before he finds something of absorbing interest.

The local reduction of a negative, for instance, is quite a fascinating process, and there are sure to be some negatives that were taken during the summer upon which to experiment. Exposures which did not result in pictures quite up to the worker's expectations can be experimented with before being consigned to the dustbin. Probably no pictures will result, but the confidence gained will be extremely valuable when the occasion arises.

Toning.

The toning of prints is an interesting side-line. The worker should avoid making himself unpopular with the evil-smelling sulphide solution, although there is no need for this to persist if reasonable precautions are taken. Hypo-alum gives quite nice tones with some kinds of papers, without the disadvantage of smell. There are numerous fancy toning ideas, such as red chalk, green, blue, etc., that are all waiting to be tried and are capable of providing untold interest.

Control Processes.

There is little doubt that the bromoil process will give the newcomer to this work something to think about for many of the long evenings. Few workers can turn out a good bromoil without a considerable amount of practice, and here the amateur may discover, as some workers have before him, that they have a particular flair for bromoil work.

Much control over light and shade can be practised by a good bromoil worker, but it must be remembered that this needs a lot of practice, and the beginner is advised to try to produce a good bromoil from a good

negative printed on to a good bromide paper, properly exposed and developed. Once this has become a routine matter, he can proceed to try control work.

The oil reinforcement process gives perhaps an easier method of control, but it is apt to produce a sorry mess in the hands of a beginner, and the latter is advised to try his skill on waste prints before attempting any of his more valuable work.

Greeting Cards.

There is one kind of indoor photographic work, however, that will claim the attention of innumerable amateurs at this time of year, and that is the printing and making of Christmas and New Year cards. Home-made varieties of these greeting cards are becoming more and more popular and most photographers like to make a few not only to send to other photographic friends, but also to display a little of their own skill.

The different applications of the photograph to the production of these personal offerings are limitless. They range from a simply mounted print to the elaborate folder with design and lettering all done by photographic means. In every case, however, they provide a useful form of indoor photography that will enable the amateur to select and display some of his best snapshots taken during the holidays. The enthusiast may even take a special subject for the purpose.

Here is plenty of scope for the worker's ingenuity, and he'll probably not find the evenings half long enough for the amount he wishes to get through.

Notes.

In all the processes mentioned, and in almost every other photographic activity, the importance of keeping a comprehensive note-book cannot be too strongly emphasised. Everything photographed out of the ordinary should be jotted down. This particularly applies to exposures in indoor work. Even when a photo-electric meter is employed variations in indoor lighting are frequently outside its scope and trial and error methods have to be resorted to. Notes of the results so obtained will prove invaluable for future reference.

Fog-days

By CHRISTOPHER WENLOCK

The Taxi-driver. A close-up in a London fog.

IT would be scarcely human to feel a thrill of joy at the sound of the fog-horn out at sea, or even on waking to find the world hidden from sight by the dense pall of mist; and yet when the white mist lies over the land the pictorial photographer may go forth, camera in hand, with keen expectation in his heart.

Fog pictures have their own peculiar charm; and it is a charm of no mean order, for there is real beauty in the "fog-scape."

It may require the artistic eye to appreciate these pictures; but the photographer is an artist, unless his role be merely that of the record-maker.

The fog when not too dense—and there is a point at which it destroys visibility altogether—softens the harshness of things, smoothes out the sharp angles and the general roughness of material objects and veils the world

A foggy day in the West End.

in mysterious gentleness. Solitary trees in the meadow and by the river-side stand out arrestingly against the screen of mist and present alluring subjects for the photographic film, as also do statues in the open places when an uninteresting or even impossible background of buildings or advertisement hoardings is blotted out or effectively subdued. There are some statues and fountains which can only be satisfactorily photographed in such circumstances; unless, of course, when floodlit.

Landscape and fog. A winter morning effect.

Vessels near the shore or in the crowded harbour dimly seen against a receding background have a fascination they do not possess on a clear day of sunlight. Many a picture is completely spoiled by the crowding and competing objects that lie beyond; these the fog mercifully wipes out or casts into dim perspective, allowing the main object to hold its own and win the attention one desires.

Street scenes take on a new significance as vehicles loom

of Winter and the Camera

up out of the mist and houses recede into invisibility. Even the hopelessness of suburban villadom ceases to repel; and excellent pictures may be made from quite commonplace streets, along which in ordinary circumstances one would scarcely deign even to be seen carrying a camera.

Gateways win a strange mysterious-

A foggy morning in the suburbs.

objects out of the mist which are scarcely visible to the eye.

Here is a field of exploration into which many have never entered, but where experiments are well worth making at the present time of year, and where really fascinating results may be obtained.

Emerging from the Underground into a London fog.

ness from the fog; the strength of the foreground makes a striking contrast with the misty effect seen through the archway. The beauty of a woodland picture is greatly enhanced if the sunlight gleams through the mist in slanting shafts. It is sometimes possible to gauge the passing of the morning mist and choose one's vantage ground to wait till the sunlight is strong enough, yet not too strong, for the desired effect.

The light on misty mornings is annoyingly deceptive; and, unless an exposure meter be employed, it is best to give a fairly generous exposure; although when the white mist is thinning before the sun an instantaneous exposure will be found quite satisfactory; and by "instantaneous," one means about one-hundredth of a second.

Winter mornings are often quite windless, allowing the employment of the stand for a longer exposure when the fog is thick; and the use of a colour filter will bring up

Late Autumn mist in the woods. The sun filtering through the branches adds to the attractiveness of the scene.

Readers' Hints, Tips and Gadgets

EYE-LEVEL FOCUSING.

THE device described below is intended to facilitate the use of a hand camera at eye-level, and will be found of the greatest assistance in photographing subjects which will not keep still. When used in conjunction with a range-finder, the device is the next best thing to coupled focussing.

The main feature is a tiny mirror, placed in such a position that on sighting an object through the direct-vision finder a

reflection of the focussing scale and pointer is seen in the centre of the line of vision. This enables focussing adjustments to be made without removing the camera from eye-level.

The construction of the device is as follows: A small thin mirror (such as ladies carry in their hand-bags) is obtained, and from it a piece about $\frac{1}{2} \times \frac{1}{4}$ in. is cut with the aid of a sixpenny glass-cutter. (The first attempt may not be successful, but there is plenty of mirror left.) Now mount this mirror

temporarily (with the aid of Plasticine) on the stirrup front or some other position directly over the focussing scale pointer; it must be fixed at an angle of 45° . Then holding the camera at eye-level, look through the direct-vision finder as though about to take a photograph, and observe whether the reflection of the focussing scale and pointer is visible in the mirror. If not, a slight adjustment is all that is necessary. Carefully observe the position, as a more permanent fixing must now be devised.

The exact nature of this will depend on the construction of the camera front, and whether there is room for the camera to close with the mirror left in position. If not, it must be made detachable. In one camera of the writer's, a permanent fixing was made by embedding the mirror in a small cube of plastic wood, and pressing this over a projecting screw on the stirrup front. This made a very satisfactory job. In another instance, where space did not allow of a permanent attachment, the mirror was fixed (again by the use of plastic wood) to the metal portion of a grid bias plug as used for wireless batteries. This was then plugged into a hole drilled in the bracket carrying the wire frame of the finder.

It will, of course, be realised that in the mirror the focussing scale is reversed, but a little practice soon makes one adept at reading the scale. Alternatively, a reversed paper scale can be pasted over the original one, which will of course appear the right way round in the mirror. In any case, when using the device in conjunction with a range-finder, it is as well to make a scale to suit the distances marked on the range-finder.

With a good range-finder fixed to the camera, the convenience of this device has to be experienced to be fully appreciated. You simply sight the object, adjust the range-finder and glance at the reading, then focus accordingly—all without moving the camera from eye-level.

R. W. FARMER.

HALF-SIZE PICTURES IN PLATE CAMERAS.

AS there seemed to me no valid reason why I, as a plate-camera user, should not participate in the convenience and economy of half-size pictures, I decided to cut my usual $3\frac{1}{2} \times 2\frac{1}{2}$ flat films in two and equip my slides to hold the half-size films.

The film is normally held in a sheath (Kalton make) which consists of a thin sheet of metal with the edges turned over to hold the film. Two identical strips of black cardboard are cut, their length being equal to the width of the full-size film and their width such as to fill up the spare space in the sheath when a half-size film is in position.

First one of these strips, then the half-size film, and then the second strip are slid in turn into the sheath, as shown in the upper sketch. The whole is then put into the slide in the ordinary way. Note that the camera, as usual in "half-size" instruments, has to be used in the vertical position for horizontal pictures, and vice versa.

The lower sketch shows, in two posi-

tions, a mask for covering the focussing screen of a reflex camera. Unless made

with a square opening, it must be reversed when the back of the camera is revolved. To make a mask for screens of other types and sizes it is only necessary to get this opening, the size of half the film, exactly in the middle and to cut the outside to fit the screen. A view-finder, if one is used, may have a thin metal mask cut to fit it, or may be masked down with black paint if the full-size film is to be permanently abandoned.

It will be appreciated that there is nothing to prevent the photographer from loading half his slides with half-size films and the rest with uncut films of the full size for which the camera was designed, and he can use them in any order. The angle of view on a half-size film is approximately that which would be given on an uncut film by a lens of focal length fifty per cent greater than the normal.

Dimensions given in the sketches are for a $3\frac{1}{2} \times 2\frac{1}{2}$ reflex, but the same methods may obviously be adapted to a camera of any size.

G. HAND.

FERROTYPE AND CHROMIUM PLATE GLAZING.

THE difficulty in this method of glazing is to prevent "cracking" of the surface.

The cause of the trouble is uneven drying, evaporation taking place more rapidly at the edges than at the centre. To counteract this, allow the prints after squeegeeing into place and absorbing surplus water by means of blotting-paper, to dry

partially, and then wet the edges thoroughly. The period which elapses between attaching the prints to the plate and the moistening of the edges is usually about one hour. Use plenty of water and make the wet border $\frac{1}{4}$ to $\frac{1}{2}$ in. according to the size of the print. The edges must be moistened before the print starts to "peel" off.

C. B.

Enlargements up to
20 diameters

with this New

Ensign

MAGNAPRINT

Super Speed Condenser Enlarger

Exceptionally large magnifications are obtained, the exact degree of enlargement varying with the lens used.

With **MAGNAR f/4.5** Enlarging Anastigmat of 60-mm. focus as fitted to Model V/9M a $1\frac{1}{4} \times 1\frac{1}{4}$ in. negative may be enlarged up to **9 diameters**, but body elevation is provided to enable enlargements up to **12 diameters** to be obtained on the baseboard from selected portions of a negative. If larger enlargements are required the supporting column may be removed and refixed so that the image can be projected on to the floor up to **16 diameters** or even larger. With **LEICA** or **CONTAX** 50-mm. LENSES as used with Models V/9L and V/9C enlargements from whole negatives 36×24 mm. may be made up to **10 diameters**, while the extra body elevation enables selected portions of the negative to be enlarged on the baseboard up to **14 diameters**.

By rotating the supporting column, enlargements up to **20 diameters** are easily obtained by projecting on to the floor.

The special book-form metal negative carrier is provided with masks for a variety of sizes and is suitable for strip films. A number of small negatives can be assembled in two rows between the glasses and each negative brought into position for enlarging by moving the negative carrier. The body is raised or lowered by a friction drive raising mechanism.

V/9M Fitted with MAGNAR f/4.5 anastigmat.....£12 10 0
V/9L For use with Leica lenses, as above, without lens.....£10 0 0
V/9C As above, but for use with Contax lenses. Without lens £10 10 0

For
Miniature
Negatives

There is an Ensign Magnaprint for every purpose—and every pocket

V/O For all miniature negatives. Enlarges a negative $1\frac{1}{8} \times 1\frac{1}{4}$ in. from $2\frac{1}{4} \times 3\frac{1}{4}$ in. up to 15×12 in. Fitted with ENSAR f/6.3 Enlarging anastigmat.....£5 5 0

V/OL For use with Leica lenses. As above, but without lens, and with helicoidal focussing device to take interchangeable Leica lenses, including special carrier for 35-mm. film.....£5 15 0

V/OC As V/OL but for use with Contax lenses.....£6 10 0

V/10 For $2\frac{1}{4} \times 2\frac{1}{4}$ in. and smaller. Enlarges $2\frac{1}{4} \times 2\frac{1}{4}$ in. negatives from $3\frac{1}{4} \times 3\frac{1}{4}$ in. up to 15×12 in. Fitted with ENSAR f/6.3 Enlarging anastigmat £8 10 0

V/10M Fitted with MAGNAR f/4.5 Enlarging anastigmat.....£10 10 0

V/11 For $2\frac{1}{4} \times 3\frac{1}{4}$ in. and smaller. Enlarges $2\frac{1}{4} \times 3\frac{1}{4}$ in. negatives from $3\frac{1}{4} \times 4\frac{1}{4}$ in. up to 15×12 in. Fitted with ENSAR f/6.3 Enlarging anastigmat.....£9 10 0

V/11M Fitted with MAGNAR f/4.5 Enlarging anastigmat.....£11 10 0

AUTOMATIC FOCUSSED MODELS

AV/O For all miniature negatives. Enlarges a negative $1\frac{1}{8} \times 1\frac{1}{4}$ in. from $2\frac{1}{4} \times 3\frac{1}{4}$ in. up to 15×12 in. Fitted with DALLMEYER f/4.5 Enlarging anastigmat.....£9 10 0

AV/11 For $2\frac{1}{4} \times 3\frac{1}{4}$ in. negatives and smaller. Enlarges $2\frac{1}{4} \times 3\frac{1}{4}$ in. negatives from $3\frac{1}{4} \times 4\frac{1}{4}$ in. to 15×12 in. Fitted with DALLMEYER f/4.5 Enlarging anastigmat.....£13 10 0

For complete details of the MAGNAPRINT Range, ask your dealer for a copy of latest booklet "On the Art of Enlarging by Ensign," or write to ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

IN SERIOUS VEIN

TO THOSE WHO look for this space each week we tender our apologies for not writing in our usual way, but the matter is, really, of some importance, and we must be serious.

Once upon a time we were inclined to view photographic societies and camera clubs with the uplifted eyebrow, and gave our opinion to our friends and acquaintances that such organisations killed individuality and retarded progress by standing in the light of the miniature. We have lately, however, been able to go into the matter thoroughly, and are more than impressed with the value of the enthusiastic and hard-working British clubs. So strongly do we feel about the matter, in fact, that we would like to see the strength of these clubs increased considerably, and, to this end, we ask all secretaries interested to write to us, when we shall be only too pleased to give particulars of a little plan which we have in mind. It will necessitate a certain outlay on our part, but we feel that it would be worth it if only a few photographers learned how to produce better work.

Apparently we've been so serious that there's no room left to get in the whole of our usual "Try 202 for Serv

A GUARANTEE,

when issued by a firm that prides itself on its straightforward and honourable dealing, gives a feeling of security to the purchaser that it would be difficult to put into words. All miniature apparatus sold by us is guaranteed against any defect whatever for one year from the date of purchase, and indefinitely after expiration of that period against any inherent defect. So, when buying your next camera, why not "Buy Lewis' and Buy Safe!"

SPECIAL WIDE-APERTURE LEICAS FOR WINTER PHOTOGRAPHY

Leica IIIa, f/1.5 Xenon. As new.	£47 10 0
Leica IIIa, fitted latest f/1.9 Hektor. As new.	£41 15 0
Leica IIIa, f/2 Summar, E.R. case. As new.	£35 10 0
Leica III, chromium, f/2 Summar, E.R. case. As new.	£32 10 0
Leica III, black, f/2 Summar, E.R. case. As new.	£31 10 0

LEICAS:

Leica II, chromium, f/3.5 Elmar. Indistinguishable from new.	£22 15 0
Leica II, black, f/3.5 Elmar, E.R. case. Practically as new.	£19 10 0
7.3-cm. f/1.9 Hektor Lens, latest rectilinear focussing. As new.	£19 17 6
Another, as above, but non-rectilinear. Excellent condition.	£17 17 6
2.8-cm. f/6.3 Hektor, nickel. As new.	£8 0 0
4-cm. f/1.5 Meyer Plasmat, for Leica. As new.	£10 17 6
Universal Finder (black). Vidom.	£3 5 0
9-cm. Elmar f/4, uncoupled. Good condition.	£5 17 6
13.5-cm. f/4.5 Elmar, uncoupled. Ex. condition.	£6 18 6
20-cm. f/4.5 Telyt Lens, with mirror reflex attachment. As new.	£28 15 0
13.5-cm. f/4.5 Hektor, with short mount, to fit above. As new.	£12 10 0
5-cm. f/2 Summar. As new, nickel.	£13 10 0
Leitz Varyl Enlarger, for negatives up to 6x6 cm., with lens. Good condition.	£14 15 0

CONTAXES:

Contax II, f/2 Sonnar, E.R. case. As new.	£39 10 0
Contax I, slow-speeds model, fitted new-type collapsible f/2 Sonnar. As new.	£29 15 0

4-cm. f/2 Biotar for Contax. As new.	£12 10 0
Contax III, f/1.5 Sonnar, case. As new.	£65 0 0
Another, as above, but with f/2 Sonnar and case.	£52 10 0

MINIATURE NEWS

THIS WEEK'S TIP.—Many workers (ourselves included) don't like to risk re-using the green coloured fixing that results when a film is given a stop-bath during processing. It's a sin and a shame to waste this, however, as it will be found to be perfectly satisfactory for fixing paper during a bout of enlarging.

OH, WHAT A CHANCE!

We have taken over the remaining stocks of the well-known Balda camera, of which we are giving an illustration herewith. These take 16 pictures on the standard 3½x2½ film, and are fitted with the f/4.5 Trioplan lens and Prontor II shutter. They are the very latest models, and are offered, brand new and unsoiled, at £4 10s., the list price being £6 2s. 6d. As you may consider giving one as a Christmas present, the carton, instructions and one year's guarantee with which each camera will be sent out will undoubtedly prove an added attraction. But please do not delay too long if you are interested at all, as stocks cannot possibly last.

CONTAXES—contd.:

Large Reproduction Apparatus for Contax 1454/28, complete with three lenses 995/32. As new.	£11 15 0
Zeiss Magniphot Enlarger, new model, with lens. As new.	£9 10 0

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS:

Kodak Regent, f/4.5 Tessar, case. As new.	£13 18 6
Dollina II, f/2 Xenon, Rapid Compur. As new.	£15 15 0
Dollina II, f/2.8 Tessar, Compur. As new.	£14 10 0
Dollina III, f/2.8 Xenar, Compur. As new.	£13 17 6

Exakta Model B, f/2.8 Tessar, non-lever wind. Excellent condition.	£20 10 0

AND TIPS DEPARTMENT

THIS WEEK'S NEWS.—A. The Orthometar (referred to last week) stood up to our mechanic's test and to our own, as a true Zeiss lens should. B. Eugradol. The 5s. bottles mentioned recently are no longer available, the only size now being supplied as standard being the larger 15s. bottle.

C. Optina.—Rolleiflex. New Rolleiflex, Rolleicord and Ikoflex users should not omit to take a note of this really cleverly conceived, accurate, and well-made accessory which has just been introduced for their use. It is an article that looks rather like a double lens cap, but is, in fact, two lenses mounted so that in one action supplementary lenses both for the finding and taking lenses on any of the above cameras can be placed in position. There are two models, one for focussing between 40 and 20 in., and one for 20 to 13 in. The greatest point of the Optina, however, is that it is COMPENSATED FOR PARALLAX. The price is 39/6, and we have stock.

MINIATURE REFLEXES—contd.:

Exakta Model B, f/3.5 Exaktar, non-lever wind. Excellent condition.	£14 15 0
Exakta Model A, f/3.5 Exaktar. Good condition.	£11 15 0

Kine-Exakta, f/3.5 Exaktar, 13.5-cm. f/4 Sonnar, chromium, 4-in. f/5.5 Ross Teleros (chromium), 5 Leitz extension tubes for portraiture and copying. Leitz lens hood. Cost £67. All absolutely as new £45 0 0

12-cm. f/6.3 Tele-Tessar for the Exakta. As new.	£10 10 0
Kine-Exakta f/2.8 Tessar, case. As new.	£29 17 6
Reflex-Korelle I, f/2.8 Tessar. As new.	£15 15 0
Reflex-Korelle II, f/3.5 Tessar. As new.	£16 15 0
Automatic Rolleiflex 6x6, f/3.5 Tessar, case. As new.	£17 10 0
Another, as above, f/3.8 Tessar, case. As new.	£14 17 6
Another, as above, f/4.5 Tessar. As new.	£13 10 0
Rolleicord I, f/4.5 Tessar, case. Good condition.	£7 10 0
Rolleicord I, f/3.8 Triotar. Practically as new.	£10 10 0
Ikoflex II, f/3.5 Triotar, E.R. case. As new.	£12 17 6
Pilot Reflex, f/2.8 Tessar, Compur. Good condition.	£12 15 0
Voigtlander Brilliant, f/4.5 Skopar, Compur Rapid. As new.	£5 0 0
Voigtlander Superb, f/3.5 Heliar, case. As new.	£14 5 0
Foth-Flex, no slow speeds, f/3.5 lens, Good condition.	£5 18 6

MISCELLANEOUS CAMERAS:

New Chromium Model Retina, f/3.5 Tessar, case. As new.	£10 17 6
Compass, latest improved model.	£19 17 6
Miniflex, f/1.8 Astro Pantachar. Cost £19 10s. As new.	£12 0 0
Nagel Rolloroy, f/2.8 Tessar, Compur. Excellent condition.	£10 10 0
Baldax, f/3.5 Trioplan, Compur shutter.	£5 18 6
Virtus, f/4.5 Skopar. Excellent condition.	£4 12 6
Vollenda, f/3.5 Radionar, Compur shutter. Good condition.	£5 18 6
Ihagee Parvula, f/2 Xenon, Compur shutter. Good condition.	£12 0 0
New Chromium Welti, parallax compensated view-finder, body release, f/3.5 Xenar, Compur shutter. As new.	£9 17 6

STOP PRESS DEPARTMENT

Available at the moment, but who knows how long stock will last with the demand as great as it is? Allow not the herbage to spring up 'neath your pedal extremities! Buy now before Time bears away the Filmarex Model O enlargers, for 6x6 cm. negatives, costing £11 8s. 6d., the New Contax Wide-Angle 3.5-cm. f/4.5 Orthometar lens, priced at £18, the Leitz VIII projector for 35-mm. films, the cost of which is £18 12s. 6d., and the Focomat 2A enlarger, which we wish we could afford for our own darkroom. Nevertheless, we are saving our weekly pennies, and if we reach £50 12s. 6d. before you do we shall chortle with joy. Still, don't let the thought of depriving us deter you from having the pleasure of using such a wonderful enlarger yourself!

R. G. LEWIS The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1 (HOLBORN 4780.) (Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

FRANK PORTRAITURE By E. E. TELFER.

I FIND that for "frank" portraiture of one's friends a miniature camera is unexcelled, and I usually carry a Baby Ikonta camera in my pocket when out with a larger camera. Although this instrument has an $f/3.5$ Tessar lens in a Rapid Compur, it weighs less than 14 ounces, and may be carried quite comfortably in the pocket. It will turn out negatives equal in quality to cameras taking negatives four times the size and costing four times the amount.

A Simple Camera.

It has no range-finder and only a small view-finder, but neither of these drawbacks is insurmountable for close-up work, as will be seen from the portraits reproduced herewith. These were all taken with the Baby Ikonta at $f/3.5$, and at a distance of 3 ft. In each case the distance was judged, and not measured.

Subjects at 12 ft. to infinity present no focussing problems with a 2-in. lens. It is only with relatively near subjects that more care has to be taken, but it cannot be emphasised too strongly that skill in judging distances is not difficult to acquire.

It is much better to train the eye to appreciate a few set distances as marked on the focussing

scale of the camera than to attempt to guess every distance that presents itself. I find it is possible to judge a distance of 3 ft. with remarkable accuracy, and for informal portraits this is a satisfactory distance at which to work.

A SMILE FROM GERMANY. $1/50$ th at $f/3.5$, Isopan F film. Late evening light.

At this distance the negative will yield a three-quarter length view of an average adult, and this allows a good margin so that an enlargement to produce just head and shoulders, which is usually all that is wanted, gives a reasonable perspective.

Judging the Distance.

An average man measures about 3 ft. from the centre of his chest to the tips of his fingers when his body is turned sideways and his arm outstretched. If an effort is made to visualise the position that the fingers would reach if this were done, a very good indication is given to the mind of a point 3 ft. away. Most people would say fairly accurately without any practice whether they would be

THE PHOTOGRAPHER. $1/100$ th sec. at $f/3.5$ on I.S.S. film.

able to touch a given object without bending the body forward, and it is this "sense" of distance that can be of help to the photographer with a scale-focussing camera marked at 3 ft.

Recognising Three Feet.

By constantly working at this distance for portraits much can be learned with regard to the size of face that should appear in the view-finder. Some preliminary exercises with a tape measure are well worth while to inspire confidence, but when the sitter is to be caught quite unawares, such contrivances must be discarded.

Even a range-finder cannot compete with the man who can judge

PORTRAIT OF A LADY. $1/50$ th sec., $f/3.5$, Isochrom film.

INCOME-TAX PROBLEMS. $1/100$ th sec. at $f/3.5$ on I.S.S. Ordinary room lighting (daylight).

AT EYE-LEVEL. 1/100th sec. at $f/3.5$, I.S.S. film.

distances well enough to be able to walk straight up to his subject and fire point blank, as the picture of "The Photographer" was taken, but that is

often the only way to get natural expressions of one's friends. Of course, it is not always necessary to be in such a hurry as that. The picture of the German girl caught with a characteristic smile was taken while I explained to her that my little camera was so harmless that it refused to take portraits altogether, and what was more had no film in it. Because she believed me I got a natural smile—or was it perhaps because she didn't believe me?

Snapping without Fuss.

On that occasion I was sitting opposite her in an open-air café, and similar conditions existed in the case of the child with the cornet and the lady in the hat. This is probably the easiest way to get a portrait without making a fuss. It is fatal to good results to ask for permission.

The picture of the young man reading his assessment form was taken at 1/10th second at $f/3.5$ in the hand, and shows that 1/10th second is quite possible, with small cameras. Whenever possible, of course, a faster shutter speed is advisable. My own preference is for $f/3.5$ and various shutter speeds according to the exposure necessary, as a wide aperture throws the background right

A BIG BITE. 1/100th sec. at $f/3.5$, Isochrom film.

out of focus. Care must always be taken that the background is not too intrusive, for a muddled background will spoil the whole effect.

Gadgets and the Inexpensive Miniature By C. O. THOMAS.

PROBABLY one of the most attractive features of the 35-mm. miniature is its versatility, largely due to the extensive range of accessories provided for use with it. The inexpensive miniature is not so well catered for, but there are many useful gadgets which can increase the versatility of this type of instrument also, and at the same time help the user to produce better pictures.

The illustration accompanying this article shows some of the accessories which I have in regular use connected with the taking of pictures as distinct from developing and enlarging. At the top will be seen a cable release, and although everyone who takes his hobby seriously has at least one of these, equally probably it is not 10 in. long as mine is.

Next in the group is a lens-hood of the type which springs on to the front cell of the lens. It has a projection at the top tapering away to nothing at the bottom, and the reason for the choice of this type is that there is less possibility of light being reflected from the inside of the hood into the lens.

The item at the top right-hand corner may not be so easily recognised, but is a detachable brilliant view-finder, which slides on to the front frame of the direct-vision finder. As with the fixed brilliant finders attached usually to larger cameras, it turns over through a right angle to enable it to be used for both vertical and horizontal pictures. In conjunction with this brilliant finder is used a magnifier, which enlarges the image and also excludes unwanted light. It clips round

With a release of this length it is easily possible to stage close-up pictures which include the photographer himself, who releases the shutter at the right instant.

I prefer this method when possible, as any delayed-action device may tend either to limit the time available, or to destroy spontaneity while the subject waits in suspense.

Of course that other essential, a tripod, was used, and as my camera has only one tripod bush a ball-and-socket head is also very valuable. This was used in taking the accessories picture, the various articles being arranged flat on the table top, with the lens of the camera pointing directly downwards.

The exposure meter in its leather case will easily be recognised, and like the camera it comes into the inexpensive category, being of the extinction type. I once checked it against a photo-electric meter, when mine said 1/50th at $f/9$ and the other 1/50th at $f/8$, which is fairly close.

the brilliant finder and I have found it very useful for close-ups, always remembering that allowance must be made for parallax.

The small "D" shaped container is the box in which the Zeiss Proxar lens is kept. This supplementary lens enables the $f/3.5$ Tessar lens to be focussed down to 19 in.

The one item which has not been mentioned so far is the brush. This is an artist's camel-hair brush, and is used for removing dust, tobacco shreds, crumbs, chewing-gum and any other of the foreign bodies which seem to be attracted irresistibly to a lens when the camera is carried continuously in the pocket. To avoid as much as possible the necessity for its use, the camera is wrapped in an oilskin tobacco pouch before being placed in its purse case.

Too many impedimenta to carry? I do not find them so, for with the obvious exception of the tripod, all are carried regularly in my pockets.

Modern Miniature Enlargers

THE VALOY.

THE Valoy is a non-automatic vertical enlarger designed for use with miniature negatives, size 24×36 mm., taken on standard ciné film. The condenser will, however, cover 3×4 cm. negatives completely, and even when enlarging from films size 4×4 cm. only about 3 mm. is lost at each of the four corners.

The baseboard, size $17 \times 15\frac{1}{2}$ in., will accommodate paper up to $15\frac{1}{2} \times 14\frac{1}{2}$ in. in size, and is of stout material. The upright in the standard model is 20 in. in height, though a taller column can be had if desired at a small extra cost.

The projector-head is in two main parts, the upper one being a ventilated cover for the lamp. This is normally a 75-watt opal lamp with screw cap, though a more brilliant light can be fitted if desired. A centring adjustment for the lamp is provided, though experience shows it to be very seldom necessary to reset it, even when changing lamps.

In conjunction with the opal lamp is used a single-lens condenser, the lower surface of which is accurately plane, and serves to hold the film flat. For 35-mm. film the carrier-slot takes a metal slide so designed that the film is held only by the perforated edges, thus providing no opportunity for scratching the negative. A similar slide, but this time including a piece of glass upon which the film is pressed by the condenser, is used for 3×4 or 4×4 cm. negatives, and with all three sizes the uncut film can be inserted into the enlarger. Troughs are provided at either side of the stage to carry the rolled-up ends of the strip of film.

The enlarger is normally supplied without lens for it is intended to take the 5-cm. lens from the Leica camera, but a 5-cm. Elmar lens specially mounted for the enlarger can be obtained if desired. A helical focussing mount is in any case provided. On the baseboard is a system of grooves, which are designed to take the clamps of the masking frame or printing-board used. As several sizes and types of printing-board are available, these are sold separately from the enlarger itself.

In use, the film-slide is drawn partly out from the carrier, the film laid on it between the guides, and the whole pushed back into the slot, where it clicks into correct position. The film is moved to right or left until the required frame exactly fills the mask, and the lever controlling the condenser is pulled forward, so allowing the condenser to drop and hold the film firm and flat. A touch on the lever frees the film again to allow the next negative to be brought into position.

With the focussing fully extended the enlargement yielded is 2.13rd diameters, giving a print about $2\frac{1}{2} \times 3\frac{1}{2}$ in. from a 24×36 mm. negative. With the projector head right at the top of the 20-in. upright, the enlargement is 0.8 diameters, so that a full Leica negative yields a print $9\frac{1}{2} \times 13\frac{1}{2}$ in. For greater enlargement the head is swung round on the upright so as to project the enlarged image clear of the base on to a sheet of paper at a lower level than the enlarging table. There is no limit to the size of enlargement that can be made in this way.

The condenser (pressure plate) can be cleaned in an instant without withdrawing it from the enlarger or allowing more than a trifling amount of white light to escape, but it can readily be removed for more drastic cleaning if necessary.

Exposures are short: even with the lens stopped down to $f/4.5$ or smaller, in making an enlargement 7×5 in. from the whole of a negative the exposure for rapid paper does not exceed 10 seconds unless the negative in question has received an unnecessarily generous exposure, and is in consequence rather dense.

Without lens or printing board, but fitted to take a Leica lens, the Valoy costs £9 11s. 6d. Further details, with prices of the various accessories, can be had on application to the manufacturers, Messrs. E. Leitz (London), 20, Mortimer Street, W.1.

Miniature Camera Gossip

By LANCELOT VINING.

I DO hope that the many who turned up to the flash-gun demonstration at the Camera Club felt that it was worth while. I had no idea that so many of my London readers would be interested in this new branch of photography. We are all indebted to the Camera Club for allowing us to use their very fine room and to Messrs. Philips for providing the lamps, and I only hope that I was able to be of use to those who were doubtful about the working of the different makes.

I was very "bucked" when I found that Ivor Castle and Monty Spry had come to support me (big names in Fleet Street, even as long ago as 1903) because we three carried out the first experiments with synchronised flash-light for the *Daily Mirror* when we photographed the Scotch express on its way North. I carried a long pole, on the top of which was a four-foot tray, and on this we spread a large bottle of Agfa flashpowder for each exposure. Castle operated a half-plate camera with focal-plane shutter set at $1/1,000$ th, whilst Spry connected us together with the electrical gear.

What a "peak" we had, and what a flash! It was no wonder that the night Scotch express pulled up one evening after passing through Willesden and reported an explosion, for the pole was nearly blown out of my hand.

SODA-WATER. $1/1,250$ th at $f/5.6$, 2-in. lens. Flash-gun.

News from the States.

Another interesting letter has reached me from Mendelssohn of New York. In it they say: "The Agfa Co. has just introduced a tremendously fast panchromatic emulsion, which they have named Super Pan Press.

It is of such speed that where newspaper photographers were accustomed to using their flashes at $1/200$ th at $f/8$, they now 'burn up' the negative at $f/16$; it seems that Agfa have stepped up the sensitivity of the emulsion at the red end of the spectrum."

A phone call to Agfa in London produced the reply that they knew nothing of this film, which is presumably made in America by the Agfa-Ansco Corporation. The letter also says:

"The amount of light which can get to a

plate or film through a Compur shutter is always from 100 to 400 per cent more than with a focal-plane shutter, when a flash is used." I always thought this was the other way about, and from my experiments with a Compur shutter on my Contax, I am afraid I do not agree with their statement, but I have made no direct comparative tests to enable me to settle the matter conclusively.

PART OF THE AUDIENCE AT THE CAMERA CLUB.
Flash-gun exposure with 2-in. lens.

Faster and Faster.

My success at stopping the water half-way between jug and glass quickly brought another request, this time—"Stop a soda-water siphon." Thank goodness there was no mention of half-way. My results proved one rather curious thing, that the gas loses its force after a few inches and the stream then becomes wavy.

Night Photography without a Tripod

By ERIC JEBSON.

"USE a tripod when photographing at night." How often do we read these words? I agree that one has a better chance of getting a good result by its use, but sometimes a subject presents itself and the photographer finds that his tripod is at home.

This was my dilemma on staying a night last May in Shrewsbury whilst the principal buildings were floodlit. My camera (Ikoflex, $f/4.5$) was loaded with Kodak S.S. film, and I wondered whether, by using my largest aperture, I should be able to get anything at all without movement. I decided to take a chance.

The Town Hall is surrounded by other buildings, and to get the floodlit tower

THE LIBRARY. 1 sec. at $f/4.5$, S.S. Pan. film.

of any size in the picture space left only one thing to do—kneel down on the pavement, rest the camera on a doorstep and shoot upwards (oh, those vanishing verticals!). A policeman who had been watching "hoped I'd got it." So did I!

Next to the market. Here a convenient bench gave the camera firm support and again a half-second was risked. The Library is surrounded by a wall and railings, which get very much in the way when seen from across the street. However, that tree seemed to have something attractive about it—the floodlit foliage would form foreground interest. To get it meant poking the camera through the railings and pressing it firmly against an upright for support.

When I got home I realised I had sunlit subjects on the same film, and as I develop in a tank, I had to give the whole film normal development. Both

SHREWSBURY TOWN HALL.
 $\frac{1}{2}$ sec. at $f/4.5$, S.S. Pan. film.

sunlit and floodlit exposures turned out satisfactorily. The prints herewith show that night photographs can be taken, if a little care is taken in holding the camera steady, even though the tripod has been left at home.

THE MARKET, SHREWSBURY.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

ONE SIZE ONLY.

I have fitted up an enlarger which consists of lamp-house, with condenser, and my camera. When enlarging to about 14×10 in. everything is perfect, but enlargements below or above this in size I cannot get sharp, although the focussing adjustment of the lens runs from infinity to $3\frac{1}{2}$ ft.

P. B. (Taunton.)

You seem to be entirely overlooking the fact that for different degrees of enlargement the distance between the lens and negative must be varied. The lens focussing arrangement is of very little use in this case, as its range is much too small. You will have to arrange to shift the lens bodily with respect to the negative. From what you say, your enlarger should be very satisfactory when this adjustment is added.

SMUGGLED CAMERAS.

I believe that a good many miniature cameras, especially of the more expensive types, are smuggled into this country. If I am offered such a camera by a private person, what guarantee have I that it is not a smuggled article?

A. S. M. (London.)

Since the owner of an uncustomed camera is legally liable for payment of duty, the point you raise is of some importance, particularly in the case of an expensive camera, as you would certainly be called upon to pay the duty if at any time you tried to bring it through an English Customs barrier. A camera not made for the English market can generally be recognised by being scaled in metres instead of feet or yards, and by having a tripod-bush larger than the one ($\frac{1}{4}$ -in. Whitworth thread) standard in this country. This may, however, have been converted to English size by inserting a bush, which is the method used on many legitimately-imported cameras. If the words "Made in Germany" or their equivalent appear on the camera (often in a very inconspicuous place) it was quite certainly made for the British market, and may therefore be presumed to have been imported through the usual channels. Inscriptions, other than names, in German (e.g., an exposure table marked "Belichtungstabelle") should cause you to regard the camera with some suspicion.

In any case where your suspicions are aroused you should demand proof of payment of duty, which the seller can provide, if the camera was imported through the usual trade channels, by obtaining an assurance to that effect from the importers.

PERSPECTIVE DISTORTION.

I enclose an enlargement from part of a 24×36 mm. negative. The portrait was taken from 12 feet away with a 5-cm. lens, and the hands (on sitter's lap and nearer to camera than the head) are too large and out of drawing. Must I expect this effect at this distance? Is there any way of avoiding it other than moving the camera farther away or using a long-focus lens?

P. G. M. T. (Gillingham.)

The oversize reproduction of those parts of your sitters which are nearest the camera depends entirely on the distance between the camera and the sitter. Changing lenses will make no difference to the relative sizes of the various parts of the sitter, but will merely alter the scale of the whole image on the negative, and of course vary the amount included.

So far as your example is concerned, we should not say it shows any distortion at all, and it is usually accepted that a distance of 12 ft. is quite sufficiently great to avoid this fault. The hands of which you complain were perhaps a foot nearer to the camera than the head; this would mean that the image of 11 in. length of hand and wrist is the same length as that of 12 in. length of head and neck. The difference in scale, as you can see, is quite small.

PHOTO-CELL METER FOR ENLARGING.

Your recent review of a photo-cell meter for enlarging suggested to me that I might use my Sixtus meter for the same purpose. Do you think that would be practicable?

R. H. G. (London.)

We do not think your Sixtus meter is likely to be satisfactory as an exposure meter for enlarging, because it will probably not be sensitive enough for the purpose. The enlarging meter which we reviewed was so sensitive that when the photo-cell was uncovered in an ordinary room, the needle shot clean across the scale even though no direct light from the window was allowed to fall on the cell.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDXIV.

Mr.
S. SMITH.

From information communicated to our Special Representative.

"ONE of my principal aims in connection with pictorial photography is the inclusion of an effect of light, for without this I consider the results are rarely satisfactory. The stressing of the light effect can often be increased by control during enlargement, and afterwards on the print. A fellow-member of the photographic postal portfolio to which I belong said recently, 'It is the light that counts; the subject does not matter'; and there is some truth in this.

"I usually take with me apparatus which, when loaded into a car, leaves no room for passengers in the rear seats. More often than not, however, my exposures are *nil*, but I find some mysterious comfort in having the stuff near by. There are times when too much photographic equipment can be a serious drawback. On many occasions I have found that before I could make up my mind which camera to use, sort out the various parts and build up ready for action, the sun had vanished behind a cloud for the rest of the day.

"A difficulty I sometimes experience is the transport across boggy moorland of an outfit occasionally used for long-distance infra-red work. This is a long box affair of my own construction, fitted with a half-plate back, and a 36-in. lens which weighs 18½ lb. Two tripods are required, and if I am working near the highway a certain amount of interest is shown by the occupants of passing motor cars. For landscape subjects I use a Sander-son half-plate field camera fitted with an f/6.8 Goerz convertible lens. With this one lens I have the choice of three focal lengths, namely, 7½, 9½ and 13½ inches—a useful variety.

"Farm work, such as ploughing, harvesting, etc., is done with a T.-P. horizontal reflex, and to the hinged lens shade I have fitted a flat metal light-shield, which is nearly the area of the camera front. This is a very efficient addition when working against the light. For architectural work I prefer a stand camera fitted with a rising front, as I do not consider the correction of leaning verticals during enlarging is very satisfactory.

"I keep a look-out for aged men with features heavily lined and suitable for large-scale heads. I use for this work a T.-P. 3¼×2¼ reflex with revolving back, and fitted with an 11-in. telephoto lens. If possible I also use a tripod, as this allows expression, etc., to be studied direct.

"Pickering, my native place, is situated near the Yorkshire moors and valleys, with a rugged coast-line not far away, and I am fortunate in having subjects which I like within easy reach. I use Ilford Soft Gradation plates, Ilford Fine-Grain and Agfa I.S.S. films, developed by tank method for rather less than normal time. I like a fairly strong negative, with prints on the heavy side. I also use Bromesko, and occasionally Gevaluxe, the maker's formula being considered best in all cases."

(A further example of Mr. Smith's work is reproduced on one of the centre Art pages.)

RIEVAULX.

S. Smith.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"DESIGN," by H. Schulman.

IN contriving a subject of this kind, the suggestion of pattern being the principal consideration, it is first of all necessary to select a scene where the main lines are pleasing in their shape and formation and then to choose such a point of view that those lines are shown to advantage and in harmony with each other.

With a series of circular steps, as in this instance, the shape, in any event, is agreeable to the eye, and, from almost any possible angle, could be made up to create an impression of design of a decorative character. Unless, perhaps, it were so arranged that the lines of the curve met the baseline at right angles (an arrangement that most people would instinctively avoid) I can imagine quite a number of differing dispositions that would well satisfy the idea that is in mind, but, having regard also to the arrangement of the light and shade, I would be inclined to wonder if, in the end, they would prove as successful.

Design in itself may be understood to provide quite a satisfactory motive of adequate æsthetic attraction, but, however good it may be, it is a cold sort of attraction and one that appeals to the intellect rather than to the emotion. The fact seems to have been realised here, and the light and shade, with its fine impression of an effect of sunshine, supplies an additional motive that lends warmth and light to the pictorial content.

It helps to make an exceedingly pleasant theme, and, incidentally, it illustrates a modern phase of work in that it combines design with the traditional conception of what a picture ought to be—a phase that succeeded the fairly recent vogue for pure design alone. In the sketch I have endeavoured to simplify the lines in order to indicate the pattern rather more distinctly than it is shown in the original, where, to some extent,

it is disguised by the intervention of shadows, lines in opposition, and incidental breaks, which lend a measure of variety and prevent the scheme from becoming too obtrusive.

The shadow in the foreground, for example, seems to cover up the junction of the main lines with the base, which, if seen in full light, would be inclined to appear a bit sudden

of position nor any appreciable contrast or weight of tone. They are only incidentals, and, in my opinion, the focal point of attraction rests with the splash of sunshine in the neighbourhood of (1). It is pretty well enclosed on three sides by shadow tone, which tends to throw up its brightness, and its brilliance is enlivened by the several touches of brighter light which

occur at the edges of the steps and on the isolated subsidiary blocks of stone which also happen at intervals within its outline. Moreover, on the fourth side, there is also a boundary in the shadow of the lowest of the steps, and, beyond that, the portion in light is of lower tone and without the touches of light which enforce the pull about the point (1).

As a matter of fact, if figures were thought desirable to stress the centre of interest—they are not really needed—they would have to be put round about (1); that is, as long as the disposition of light and shade remained the same, for, if they were put anywhere else, they would upset the whole design. It would be desirable, also, that they should possess a more vivid contrast of tone than is shown elsewhere, and that, if they extended so far as to impinge upon the darker tone above, the parts that did so should be mainly in light. If they were appropriate to the surroundings, properly posed, and caught without betraying camera-consciousness and in such a way that they seemed natural adjuncts of their setting, it is possible that their introduction would enhance the interest.

But it can stand quite well without them, and, indeed, it is better as it is than it would be if the figures displayed any incongruity, any deficiency in posing, or conveyed an impression of being aware of the camera or having been placed there for the purpose. As it stands, the design is attractive and the sunshine delightful. "MENTOR."

and abrupt, and, in the top left-hand corner, the wall in shade and the stretch of shadow below provide a stop which has the effect of keeping the eye "in" the picture, the effect being stressed by the presence of the two diminutive figures within the shadowed area.

They are, however, so small that I do not think they can be regarded as doing anything else, although, perhaps, they do provide a sense of scale, and they certainly do not—as figures usually do—provide a centre of interest, for not only are they barely perceptible against their setting of shadow, but they neither have strength

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

IT is rather a curious thing—and one that is more noticeable in the work of beginners than that of the more experienced worker—how very seldom it is that an aptitude for choosing an attractive pictorial theme is accompanied by the faculty of expressing it properly, or as well as it could be if the technique were adequate.

Choice of Subject.

As a rule, too, the converse holds good—excellence of technique, more often than not, is displayed in connection with subjects that have little artistic attraction, and it cannot be too strongly urged that one is no good without the other.

The best of any subject cannot be fully conveyed if the workmanship is inadequate, and technique is no use unless it can be exercised upon something that is worthy of it.

To take two of the prints from the collection on the opposite page as examples, No. 3, "Youth," by J. Greenwell, is a well-chosen subject with an attractive effect of sunshine, but its workmanship is indifferent and renders the attraction it should possess abortive. No. 6, "Daffs," by William Lee, is a sound piece of technique, but the flowers are as stiff as ramrods and scarcely show even an elementary idea of arrangement. The blooms are too close together, are too evenly illumined, and the setting strikes me as being much too dark in comparison with the flowers.

Let them be placed farther apart and in some sort of order—not too formal and yet not so much out of order as to suggest disorder—and let the setting be of lighter tone. Then the arrangement will seem much better.

Technique and Arrangement.

At the same time, the question of the lighting should be considered. After the arrangement has been revised, one of the flowers will be in a stronger position than the rest and will assume priority in the group. The lighting should be so arranged that this particular bloom is rather more brightly lit than the others, and, as far as possible, the others should be illumined in the order of their attraction.

But the whole question of arrange-

ment and lighting in a study of this type should be made the subject of experiment. All sorts of arrangement and various descriptions of lighting can be tried, exposures being made as and when a pleasing combination arises. Working to a plan in this way can be most fascinating, and, moreover, is more likely to lead to fine results than chance exposures haphazardly arranged.

With No. 3 the figures are extremely well caught; they are nicely placed in the picture space; the arrangement otherwise does not offer much occasion for criticism, although, perhaps, a dark on the right would be advisable to balance that of the left; and the feeling of sunshine, if properly reproduced, would have been delightful and have rounded off a well-thought-out scheme.

All the lighter tones, however, seem to be washed out and deficient in modulation. They are indecisive and uneven where they should be even; parts appear to be fogged and smeary; and the print conveys the impression—whether such is the case or not—that an attempt at control has been made without the capacity to carry it out.

Adequate Expression.

It may be, however, the effect of forced development upon a print that has not received sufficient exposure, for I have seen somewhat similar results arising from such a cause. It will easily be appreciated that, with an inadequate exposure, high-light modulation is impossible, and, in such circumstances, prolonging development would have no other effect than to fog the print. If such was the case with this example, the remedy is obvious, and, if it arises from an improperly executed effort at control, it is probable, if the negative is untouched and does not betray any fault, that reprinting on a softer grade of paper would effect the needful improvement.

As the print stands, it is quite evident that the technique is inadequate for the full expression of the subject, and, while I should be inclined to view it as the best chosen picture on the page, I am sorry to have to say that it is utterly ruined by the hopelessly slipshod character of the print. No. 1, "Timber to Penzance,"

by Geoffrey Seddon, offers a very considerable improvement, for, if a trifle sombre, its tones are well defined and there is no suspicion of unevenness or any deficiency in technique.

Pictorial Appeal.

But, here again, there is little in the subject to lend it any attraction of a pictorial nature and any interest it may have is of a topical character.

The same might well be said of No. 4, "O.H.M.S.," by K. Stroud, and the subject is at a very considerable disadvantage in that most of the figures are conscious of the camera and show it only too aggressively. The figure in No. 2, "Where's That Fox?" by Miss A. Franklin, does not display the same drawback, but, being placed in the background, is not so important in comparison with the hounds which are nearer to hand.

And what do we see with these? The nearest has a head but its hind-quarters are cut off; the next is much about the same; those in the rear are mixed up in confusion; and the one on the right has lost its nose! Quite obviously, the moment for making the exposure was badly chosen and nothing can now be done to afford any improvement. On the other hand, the figures in No. 7, "The Gossips," by H. G. Holt, are caught at a fortunate moment, and, apart from the fact that a little more foreground would be desirable, they are nicely placed in the picture space.

Printing Depth.

Technically, however, the picture is much over-printed and, were it carried only to a proper depth, it is highly probable that it would be found lacking in contrast.

The probability is that a more vigorous paper is needed, but, though it could be expected to provide a brighter print, the subject itself seems lacking in brightness and the absence of sunshine is severely felt. No. 5, "Pigeons," by P. W. Pratt, is another example that is characterised by excellent technique, and the skill with which it has been taken is admirably in evidence, but, though it is clever and the moment for making the exposure most precisely chosen, pictorially it leaves me cold. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

EXPERIMENTS INDOORS.

THERE are few things in which we can become really expert without plenty of practice, and photography is certainly not one of the few. In a sense every exposure we make is a bit of practice, but this is more or less casual, and we ought sometimes to make experiments with a definite object in view. Many of these can be carried out at home, and this is a good time of year for the purpose; so I hope from time to time to suggest one or two photographic exercises that should help us to better and more intelligent work later on.

Some of these experiments can only be carried out thoroughly by means of a camera with a focussing screen, and preferably one with which plates can be used. It need not be large, elaborate or expensive; and once more I would strongly urge the beginner to get something of the

Fig. 1.

Fig. 2.

kind, not only for experiments, but for work which cannot be done equally well with some other kinds of apparatus. A few plates of different kinds—process, ordinary, orthochromatic and panchromatic—should also be obtained and their character and uses studied.

I am repeating some old illustrations for the present experiment, which I hope many beginners will carry out in some form or other for themselves. This is far better than merely reading about it.

Here are a few yellow flowers set up on a table indoors against a card background, which was a dark grey of decidedly blue character. The subject was first photographed on a slow ordinary plate, and the print from the negative is Fig. 1. At a glance it is evident that the tone values are hopelessly wrong. The eye saw the flowers

Fig. 3.

light against dark; the print reverses the effect. Then I made another exposure on an ortho plate without a filter. This result is not shown, but it was better than Fig. 1. Next, with a similar plate I used a deep yellow filter, with the effect shown in Fig. 2. This shows over-correction, as the filter cut out so much of the blue that the background is much darker in comparison with the flowers than it appeared to the eye. A paler filter would have put matters just right.

Such experiments, at the cost of a few plates, will teach us a great deal about colour values in our prints; we shall see where they are wrong, and know how to improve them in the future.

We shall know a great deal more if we can make a few comparative tests with one or two different filters, and find out what colours they modify and to what extent. But even such simple experiments as I have suggested are very helpful.

W. L. F. W.

THAT LANTERN LECTURE

By
C. L. HARD.

SO you are toying with the idea of giving a lantern lecture, and would like to know whether it is as easy as it sounds?

Well, it is really not difficult, but an audience must be "held" just as much under the cover of darkness as in a well-lit hall. That means you must keep your wits about you, and to a beginner the mental alertness necessary to keep one eye on the clock, one on the screen, and maintain a variation of patter while introducing slides is all rather awe-inspiring.

This awareness is largely a matter of practice, however, and an unruffled bearing at a slight contretemps works wonders, as for example when a slide jams in the lantern, or is inserted wrong way up. Even given the gift of mental resiliency in this way, a little forethought is invaluable here as in other branches of photography.

The time allowance is most important. Find out your allotted span in advance, and plan to cover it smoothly and unhurriedly. Do not fall into the error of a too ambitious start leading either to a rushed conclusion or a lengthy lecture. Good slides deserve their share of your time, and a

hasty shuffle through at the end ruins all the good impression you may previously have made.

Time yourself over a batch of slides at home, passing what you think will be your average comments, and base the lecture on the results obtained. It is as well to ascertain if a short break is made in the middle of the lecture for refreshments, and, if so, to allow for it.

Another bearing on the time question comes from the fluency obtained by constant re-reading of your subject matter. Hesitancy falls away, and the more confident pitch in your voice makes your commentary brighter.

A useful habit, where possible, is to confer with your lanternist in advance, learn his ways, and adopt the signalling system he recommends. This may save lack of co-operation later.

You have a big decision to make if this is your first lecture—namely, the way in which you will deliver it. One lecturer prefers to read from notes, another to chat breezily on each slide as it appears, while a third will have a skeleton outline of his main points in front of him and depend on the slides for his continuity.

If you can, avoid the first method for by it all spontaneity is lost and dullness is an ever-present risk. On the other hand, noteless independence is rather much to expect of a beginner, so you would be well advised to adopt the compromise of the third method. This entails memorising as much as you can by constant re-reading, preferably with oral repetition as well. Summarise your remarks with a key-word for each section, and equipped with this synopsis and a list of the slides alongside you should do well.

Don't be afraid of giving a personal flavour to your remarks; this you will find easier if you are lecturing on your own slides. If your lecturing career is to start, as many do, with a travel talk on your holidays, for example, then you can include some of the humorous little misadventures that occur on all holidays, and you will find your audience warming to you and becoming intrigued. Once you have broken the spell, as it were, with a laugh in this way, your self-consciousness will have gone, and you will sail on effortlessly. And at the end you will find you have given a good lecture.

MAKING BETTER SNAPSHOTS—26

By DAVID CHARLES.

This article is the twenty-sixth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. Incongruous surroundings, and lack of relationship between the figures, makes this first effort uninteresting.

THIS time of year, when the evenings are approaching their longest, is the season for "still life." Subjects of this class are innumerable, but the general principle is to find some pretty things, arrange and light them prettily, and photograph the result.

Any camera that will focus as near as 30 or 36 in. is suitable, but if the focussing scale does not extend so far,

Fig. 2. Under-exposure blends detail into the shadows. Still-life shows up variation in exposures more than outdoor work.

or even if there is no focussing adjustment at all, a magnifier or "portrait attachment" is all that is needed. At such close range the finder will not show quite the same view as that included by the camera, but this can be attended to by putting a temporary focussing screen (of grease-proof paper if no ground glass is available) into the camera before loading it, and comparing the view seen there with that in the finder. As for lighting, a Photoflood is only better than an ordinary lamp because it allows shorter exposures; the finished results are the same.

Fig. 1 is characteristic of the results of the too-hasty sportsman. It is a technically good print of the objects and their surroundings, but though the figures are attractive, their arrangement is too casual and their surroundings, in particular that intruding bowl, have not been considered at all. The revised version of Fig. 2, where an oriental tray is used as background, and the figures, instead of coldly turning their backs on one another, are both looking at the camera, is a great improvement.

But the print is rather a jumble of shadows; perhaps the lamp had been moved farther away and no increase in exposure given. The rule "double distance means four times exposure" must not be

Fig. 3. Turning the figures so that the woman looks down at the man's hand gives a "motif" to the picture.

forgotten. And being taken with but one lamp, the shadows are in any case too numerous and too deep. A white reflector to send light on to the shadow side will soon correct that; a large white card, or even a towel, will do. Re-posing the figures and revising the lighting then gives us Fig. 3.

The polished tray has reflected the reflector and so become light, bringing out its detail splendidly. But it has rather too even a tone to be interesting. By covering the outer part of the reflector, keeping full reflection in the middle only, we get just a central bright patch on the tray, while a slight shift of the lamp brightens the man's face. So now, in Fig. 4, we have put both life and mystery into what at first was just a "still."

Fig. 4. The background is now broken up and softened, except for the essential detail in its centre, and the harsh lighting on the group is also corrected.

Fig. 5. This is the whole negative of No. 4, taken so because the camera would not focus closer than 3 ft.

"The Amateur Photographer" ANNUAL LANTERN-SLIDE COMPETITION

LIST OF AWARDS.

CLASS I. LANDSCAPE, WITH OR WITHOUT FIGURES, SEA SUBJECTS AND RIVER SCENERY.

SILVER PLAQUES.—"The Dam," by John D. Jones, Sandycroft, Silkmore Lane, Stafford; "Smoke," by Miss Anne Jackson, 61, Richmond Grove, Manchester, 13.

BRONZE PLAQUES.—"Drainage," by C. Fry, 29, Nettlecombe Avenue, Southsea, Hants; "Snow," by S. H. Clarke, 20, Glen Eldon Road, Lytham St. Anne's, Lancs.

CERTIFICATES.—"Autumn Sunshine," by H. Caldwell, 49, Norwood Crescent, Southport; "A Cool Re-reat," by P. S. Johnston, 67, Kimble Road, Colliers Wood, London, S.W.19; "Harvest Time," by B. Garth, 38, Church Street, Smedley Lane, Manchester, 8; "The Guiding Light," by G. W. Bott, 407, Yardley

Road, South Yardley, Birmingham, 25; "East Wind, West Sun," by Bernard Wakeman, Vale View, Dartmouth, Devon; "Poole Harbour, Dorset," by S. J. Beckett, Pineville Hotel, West Cliff, Bournemouth; "Willow," by J. H. Clark, 304, Camberwell New Road, London, S.E.5; "On Rombalds Moor," by John W. Ratcliffe, 701, Rochdale Road, Royton, Oldham; "Winter's Cushion," by W. H. Hardcastle, 23, Moor View Road, Sheffield, 8; "Evening Walk," by Arthur B. Bishop, 36, King Road, Knowle, Bristol, 4; "Seashore Design," by E. Ronald Sleep, 46, Fisher Road, Newton Abbot, Devon; "The Twin Peaks," by A. C. R. Redgrave, 84, Norfolk Road, Cliftonville, Margate; "The Beach Road," by R.

Kermode, 80, Cambridge Road, Southport; "Cutting the Hay," by D. G. Wraith, 41, Branksome Wood Road, Bournemouth; "River Larroch," by R. W. A. Burgess, Ben Bhan, 193, Dimsdale Parade, Wolstanton, N. Staffs; "Summer Breezes," by S. H. Clarke, 20, Glen Eldon Road, Lytham St. Anne's, Lancs.

In this class slides by the following competitors were selected for purchase: G. H. Grundy (Newcastle, Staffs); (2) R. C. Jude (St. Ives, Hunts); (2) Edward Steel (Carlisle); Peter Hennessy (Newton Abbot); R. Brownword (Newcastle, Staffs); H. Montague Storey (Bradford); (2) William Jackson (Hull); S. J. Beckett (Bournemouth); Fred Lord (Harpenden); J. Ludlam (Leicester).

CLASS II. PORTRAIT AND FIGURE STUDIES, WHETHER INDOOR OR OUTDOOR PICTURES.

SILVER PLAQUES.—"The Idealist," by H. Bryce Thompson, 2, Belmont Grove, Leeds, 2; "Three Times a Day," by C. A. Peirpoint, 42, Anson Road, Cricklewood, London, N.W.2.

BRONZE PLAQUES.—"Happy Childhood," by Arthur B. Bishop, 36, King Road, Knowle, Bristol, 4; "A Fisherman of Cockersands," by Samuel Thompson, West Bank, Scottforth Road, Lancaster.

CERTIFICATES.—"Young John Bull," by Miss Anne Jackson, 61, Richmond Grove, Manchester, 13; "In Moreton Old Hall," by Charles Eshborn, 57, Worsley Road, Farnworth, near Manchester; "Enticement," by E. G. Raines, 7, Worcester Terrace, Bristol, 8; "Pat Davis," by F. G. Turner, 171, Chesterton

Road, Cambridge; "My Lady's Maid," by Arthur B. Bishop, 36, King Road, Knowle, Bristol, 4; "On Top of the World," by L. H. Openshaw, 22, Parklands Drive, Broughton, Preston; "Decorator," by H. Caldwell, 49, Norwood Crescent, Southport; "Trouble with the Stove," by G. C. Backhouse, 16, Sandhurst Grove, Leeds, 8; "Cornwall," by Fred Lord, Reversion, Topstreet Way, Harpenden; "Watching the Clouds," by W. Gregory, 13, Plumley Drive, Darley Park, Manchester, 16; "Lazy Pip," by Richard Wagstaff Gibbs, 10, Milton Street, Nottingham; "The Amateur Mechanic," by Horace Swindlehurst, 1, Herbert Street, Padham, Burnley, Lancs; "Mountain Ozone," by Ernest Tinker, 159, Rock Street, Sheffield; "Going

Shopping," by Fred Lord, Reversion, Topstreet Way, Harpenden, Herts; "Sonny Boy," by H. Montague Storey, 24, Lynton Avenue, Heaton, Bradford; "The Dancer," by E. Ronald Sleep, 46, Fisher Road, Newton Abbot, Devon.

In this class slides by the following competitors were selected for purchase: (2) A. B. Bishop (Bristol); (2) Samuel Thompson (Lancaster); M. Walker (Balham, S.W.); George Clarke (Carlisle); F. G. Turner (Cambridge); J. F. M. Chambers (Beeston); S. J. Beckett (Bournemouth); W. Gregory (Manchester); C. K. Richmond (Bristol); H. Bryce Thompson (Leeds); Bernard Wakeman (Dartmouth).

CLASS III. ARCHITECTURE, INTERIOR AND EXTERIOR.

SILVER PLAQUES.—"A Side Chapel, Acton Church, Cheshire," by Harry Chapman, 30, Radstock Road, Stretford, Manchester; "Dutch Woodwork," by E. Dodshon, Durham House, 124, Old Christchurch Road, Bournemouth.

BRONZE PLAQUES.—"A Welsh Castle," by Henry Riley, Brantwood, Manchester Road, Westhoughton, near Bolton, Lancs; "Sunshine Alley," Richard Wagstaff Gibbs, 10, Milton Street, Nottingham.

CERTIFICATES.—"Stall Canopy, Cartmel Priory, Lancs," by H. E. Illingworth, Carbrayne, Leadhall Lane, Harrogate; "Italian Hill Town," by R. Kermode, 80, Cambridge Road, Southport; "The Founder," by Hubert Henshaw, 149, Clarence Street,

Bolton; "South Aisle of Choir, St. Paul's Cathedral," by R. C. L. Herdson, 88, Elfindale Road, London, S.E. 24; "Abbey Precincts," by George A. Slight, 18, Ewelme Road, Forest Hill, London, S.E.23; "A Quiet Corner," by L. A. Ward, 21, Cranley Drive, Ruislip, Middx.; "Sunshine, Rain and a Traffic Light," by E. Dodshon, Durham House, 124, Old Christchurch Road, Bournemouth; "Venetian Canal," by Richard Wagstaff Gibbs, 10, Milton Street, Nottingham; "A Corner in a Norman Crypt," by J. Ludlam, 115, Gasmere Street, Leicester; "Scotney Castle, Lamberhurst," by S. K. Lazell, Lyndhurst, Ravenswood Avenue, Tunbridge Wells, Kent; "Alexander's Flight (Misericord, Cartmel Priory)," by Miss

Anne Jackson, 61, Richmond Grove, Manchester, 13; "Gleams of Sunlight in the Transept, Groote Kerk, Haarlem," by E. Dodshon, Durham House, 124, Old Christchurch Road, Bournemouth; "The Font, Hammer," by E. B. Marks, Aalsmeer, Regent Street, Stoke-on-Trent, Staffs; "Ancient Church Door, Norway," by S. J. Beckett, Pineville Hotel, West Cliff, Bournemouth.

In this class slides by the following competitors were selected for purchase: (2) R. Kermode (Southport); W. S. Sanderson (Carlisle); J. H. Clark (London, S.E.); Fred Lord (Harpenden); J. Ludlam (Leicester); S. J. Beckett (Bournemouth); E. B. Marks (Stoke-on-Trent).

CLASS IV. FLOWERS, FRUIT, AND OTHER "STILL-LIFE" SUBJECTS.

SILVER PLAQUE.—"After the Shower," by John Hume, 61, Jesmond Dene Road, Newcastle-on-Tyne, 2.

BRONZE PLAQUE.—"Workers Resting," by Bernard Wakeman, Vale View, Dartmouth, Devon.

CERTIFICATES.—"Curtain Piece," by W. A. Lynch, 58, Church Aston, Newport, Shropshire; "Caltha Palustris," by H. C. Ward, 6, Coniston Road, Barne-

hurst, Kent; "Apple Blossom," by Fred Lord, Reversion, Topstreet Way, Harpenden, Herts; "All Wired Up," by William Jackson, 105, Park Grove, Hull; "Garden Spider's Web, Early Morning," by Miss Anne Jackson, 61, Richmond Grove, Manchester, 13; "In Canterbury," by Charles Eshborn, 57, Worsley Road, Farnworth, Lancs; "Rhododendrons," by T. C. Crabtree, 73, Hollingreave Road, Burnley,

Lancs; "Alpine Pink Primula," by J. F. Cutler, 52, Gibbs Green, Edgware, Middx.

In this class slides by the following competitors were selected for purchase: David McKenzie (Kilmarnock); B. Garth (Manchester); R. C. L. Herdson (London, S.E.); H. F. Taylor (Liskeard); Hubert Henshaw (Bolton); H. C. Ward (Barnehurst, Kent).

CLASS V. NATURAL HISTORY SUBJECTS.

SILVER PLAQUES.—"Disputed Possession," by E. Ronald Sleep, 46, Fisher Road, Newton Abbot, Devon; "Hippo," by R. W. A. Burgess, Ben Bhan, 193, Dimsdale Parade, Wolstanton, N. Staffs.

BRONZE PLAQUES.—"Ah! Up There Are You!" by John W. Ratcliffe, 701, Rochdale Road, Royton, Oldham; "Large Cabbage White Butterfly," by Miss Anne Jackson, 61, Richmond Grove, Manchester, 13.

CERTIFICATES.—"Gannet in Flight," by H. S. Thompson, 89, Tynemouth Road, Newcastle-on-Tyne,

6; "A Pair of Black-Throated Divers," by J. E. Ruxton, 17, Queen's Road, Blackhill, Co. Durham; "Do Not Disturb," by S. D. Barnwell, 76, Silkmore Lane, Stafford; "Tigon," by R. W. A. Burgess, Ben Bhan, 193, Dimsdale Parade, Wolstanton, N. Staffs; "Whipsnade Wolves," by Allan P. Morris, 81, Ainsworth Road, Radcliffe, Lancs; "Head of a Condor Vulture (Belle Vue Zoo)," by B. Garth, 38, Church Street, Smedley Lane, Manchester, 8; "Thrush Feeding Young," by A. R. Yarwood, 39, Trevor Road, Burscough, Lancs; "Cuckoo and Meadow

Pipit," by Dr. A. H. Murch, 6, Avenue Road, Brentwood, Essex; "King Vulture (Belle Vue Zoo)," by Miss Anne Jackson, 61, Richmond Grove, Manchester, 13; "Hen Blackbird at Nest," by E. P. Jeffree, Queensbower, Newchurch, Sandown, I.O.W.

In this class slides by the following competitors were selected for purchase: (3) H. S. Thompson (Newcastle-on-Tyne); R. W. A. Burgess (Wolstanton); B. Garth (Manchester); S. D. Barnwell (Stafford); R. G. Allen (Stafford).

CLASS VI. LANTERN SLIDES IN COLOUR (Not Hand-Coloured).

SILVER PLAQUES.—"Barnard Castle," by Richard E. Booth, Alvenza, Kirk Ella, E. Yorks; "Norwegian Horse," by Lilian F. Thomas, 27, Roberts Road, Liverpool, 4.

BRONZE PLAQUES.—"Centre Court, Mortimer Museum, Hull," by J. W. Atkinson, Gasmere, Beresford Avenue, Hull; "Still Life," by R. N. Watson, 19, Arbour Street, Southport, Lancs.

CERTIFICATES.—"Langdale Valley," by A. J.

Thomson, 101, Cavendish Street, Keighley, Yorks; "Willow," by J. H. Clark, 304, Camberwell New Road, London, S.E.5; "June Roses," by H. Caldwell, 49, Norwood Crescent, Southport; "Yarmouth, I.O.W.," by L. Hansford White, Orchard End, Bourne End on Thames; "Birch and Beech," by Miss Isobel Simpson, 369, Blackness Road, Dundee; "Pose for a Square Format," by R. N. Watson, 19, Arbour Street, Southport; "The Joy Ride," by Hugh Eller-

ton, 56, High Street, Newchapel, Stoke-on-Trent; "White Wing," by R. C. Jude, 2, The Quadrant, St. Ives, Huntingdonshire.

In this class slides by the following competitors were selected for purchase: Mrs. M. T. Pollit (West Kirby, Ches); J. W. Atkinson (Hull); (2) Bernard Wakeman (Dartmouth); Hugh Ellerton (Stoke-on-Trent); P. S. Johnston (London, S.W.); Lilian F. Thomas (Liverpool); R. W. A. Burgess (Wolstanton).

CLASS VII. CHAMPION CLASS. Open only to those who have previously won Silver or Bronze Plaques in "The Amateur Photographer" Lantern-Slide Competitions.

"The Hearth, The Centre of the Home," by S. J. Beckett, Pineville Hotel, West Cliff, Bournemouth.

In this class slides by the following competitors were selected for purchase: H. Chapman (Stretford, Manchester); W. Hill (Leek); George A. Slight

(London, S.E.); H. Carlile (Paisley); H. Bryce Thompson (Leeds); Arthur B. Bishop (Bristol); Miss M. K. Lack (Streatham, S.W.).

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Starting the Home Cinema Film Hiring Arrangements.

By T. F. LANGLANDS.

MOST of the pleasure in amateur cinematography, for family and friends, lies in the screening of films in the home cinema, and however many personal films one may possess of home and holiday incidents taken during the summer months, one soon feels the need to supplement them by the purchase or hire of professionally-made films.

Unless one is prepared to spend rather substantial sums in acquiring a wide range of films by outright purchase, it is best to buy only those films that are likely to retain a permanent appeal and future interest (such as subjects of modern historical happenings, as the Coronation) and to hire all other reels of suitable subjects, as and when they are wanted. It is seldom that one feels a particularly violent urge to see any film over and over again, so from the start a register should be kept, in order to verify in the future which titles have been seen already; then they can be repeated or avoided as tastes demand.

Now there is more than one way of hiring films; and the most expensive and least satisfactory method is to go into the dealer's premises at the week-end for them, and thereby pay top hiring rates for a totally inadequate selection of subjects. The best manner is which to tackle film hiring, both as it concerns one's pocket and the point of view of pleasure also, is to get first of all some catalogues of the films available in the particular gauge that you use, and compare the hiring charges of different dealers; not with the sole idea of getting the cheapest terms, but with a view to obtaining the biggest range at the most reasonable overall costs.

As the hiring arrangements of the different amateur gauges, 8 mm., 9.5 mm., 16 mm., are not identical, we must treat them separately. The 9.5-mm. films are closely linked with the Pathéscope Company, and therefore for choosing titles from all 9.5-mm. libraries, the most useful book to have is the sixpenny green-covered catalogue of Pathéscope. As this is classified by subjects, the beginner must note that films prefixed by "S," "SB" or "M," of 300-ft. or 200-ft. length, are the only ones generally offered on hire by most dealers.

The shorter 30-ft. and 60-ft. films are, as a rule, available for purchase only; indeed such short lengths alone would prove tedious in use for an evening's entertainment. Therefore, for hiring, ignore all numbers in the catalogue that

do not carry the prefixed letters. Furthermore, although these three classes will all run through any 9.5-mm. projector fitted with the necessary super-film attachment, the "S" films have only short, notched titles, which will not be readable as they flash by on some machines.

The most familiar projectors which incorporate a title-arresting device are the "Bolex" P.A. and D.A. models, some "Alef" models, and the Pathéscope "Lux," "Kid," "Imp," and "Home Movie" models. As notched "S" films are now going out of favour, due to more powerful projector illuminants (necessitating a continuously moving film) there is no need to worry unduly if one cannot use them on any particular projector.

Publicity films are also available; these contain much interesting matter interwoven naturally with advertising topics, and they are mostly offered free to serious projectionists; they form a valuable aid in adding to one's programme at little or no expense. Details of these and the addresses to which

application has to be made, are to be found in the "Pathéscope Monthly," a regular publication of value to all 9.5-mm. users, which can be obtained free from most ciné dealers.

Next, on studying the film hiring arrangements offered by various dealers, you will note that there is a great deal in favour of taking out a subscription (for the hire of a determined number of reels, as and when required) compared with casual hiring. For example, if you are a subscriber you can not only book a particular programme some time ahead and make sure of getting new issues, but in addition the hiring period is often longer. Day-by-day casual hire may cost the hirer anything from 1s. 6d. to 2s. 6d. per reel for week-ends, and even then no particular titles may be guaranteed; you have to take just what is left on the shelf. A subscription (e.g., some dealers offer thirty super reels for 42s.) enables one to be sure of getting the desired films as and when wanted, and, furthermore, may entitle the subscriber to keep them each time for anything up to five days. Of course,

Enthusiasts. A joggly winter morning in the Park. Even this phase of a familiar subject will prove useful in completing the series for a London documentary.

one may take a reel or more as required until the total subscription quota has been hired, entirely as the hirer chooses.

For 16-mm. users somewhat similar conditions obtain, but the films come from different sources; this year sees a substantial reduction in the hiring rates in the Kodak library, which with others may be booked through local dealers. Again, by arranging to book, say, 100 reels over a period, big reductions in hiring rates are offered here. Kodak Ltd., Ensign Ltd., Messrs. Wallace Heaton Ltd., all issue catalogues of 16-mm. films for hire, and the last mentioned have nearly 1,000 reels with a coupon subscription system which enables the careful chooser to hire feature films to a total of eighty reels or so, for week-end periods, for an outlay of £5, or approximately 1s. 3d. per reel. This furnishes an illustration of the economies obtained by subscription; as the same films would average over 2s. per reel if hired at ordinary week-end rates.

For 8-mm. film hiring, Kodak Ltd. issue a catalogue covering a wide range of tastes, and both they and Ensign Ltd. have numerous 8-mm. films for outright purchase. Some of these cost only 7s. 6d. for a 50-ft. reel.

For more ambitious amateurs who want "the real thing" we must not overlook the ever-increasing library facilities available in sub-standard talkie films. The biggest sound film library in this country is that of the Gaumont-British, "Gebescope"; also Messrs. Wallace Heaton Ltd. and the Brunswick Film Co., amongst others, have sound-film libraries in 16-mm. gauge; there is also a 17.5-mm. sound-film library by Pathéscope Ltd. Each of the firms referred to will willingly send full catalogues and particulars free on request.

In many instances the cost of a sound-on-film projector is little, if any, more than that of a silent machine, and amateurs working with 16-mm. cameras should note that their own

silent films, as well as silent library films, will work on almost all models of sound projectors of similar gauge.

Finally, just one suggestion to give your home shows a professional finish. Whatever gauge of film is used, get your dealer to have an appropriate personal introductory title made, that can be attached to your own, or library films, to herald the most important reels of the evening. Of course, you can name your cinema after the house or district, and so: "The Laurels Cinema presents..." or "Algernon Adenoids has pleasure in presenting..." perhaps, "The management of Sam's Cinema invite you to see..." Such introductory or closing announcements can give an impressive finish to one's home shows, and once made, the films may be spliced into, and removed from, the reels again and again without trouble. The only accessories needed are a splicer and some cement, which should be in the possession of every amateur already.

Exhibitions and Competitions CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, December 31. Rules in the issue of November 24.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Winter Snapshot Competition for users of the Purma Special Camera. £100 in cash prizes.—Particulars and entry forms from R. F. Hunter Ltd., 51, Gray's Inn Road, W.C.1.

Folkestone C.C. Exhibition of Photography.—Open, October 23–December 4. (A. J. Stewart, 25, Guildhall Street, Folkestone.)

International Photographic Exhibition in Debrecen (Hungary).—Open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

Xie International Fotosalon "Iris".—Open, January, 1938. (F. Geeraerts, Brederodestr, 22, Antwerp, Belgium.)

Preston S.S. (P.S.) Thirteenth Annual Open Photographic Exhibition.—Entry forms, January 7; exhibits, January 14. (F. Wells, 65, Powis Road, Preston, Lancs.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938.

(N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Aberdeen P.A. International Exhibition of Photographic Art.—Entries, January 15, 1938; open, February 5–26. (Miss Hilda N. Bailey, 63, Watson Street, Aberdeen.)

Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7–12. (T. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.) Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31; open, March 7–12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)

L.M.S. (London) P.S. 13th Annual Exhibition.—Entries, February 1; open, March 7–12. (Hon. Exhibition Secretary, L.M.S. (London) Photographic Society, 1, Euston Square, London, N.W.1.)

Birmingham P.S. 47th Annual Exhibition.—Entry forms, February 3; exhibits, February 5; open, February 26–March 12. (E. H. Bellamy, 20, Waterloo Street, Birmingham, 2.)

City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday, February 7; open, March 7–12, 1938. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.) Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April, 1938. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2; Entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Scottish Photographic Federation 30th Scottish National Salon.—Entries, March 2; open, April 2–16. (Percy H. Cartwright, 52, High Street, Galashiels, Scotland.)

Hackney P.S. 49th Annual Exhibition.—Entries March 7; open, March 30–April 2, 1938. (Walter Selfe, 9, Fairlight Avenue, Woodford Green, Essex.)

XVIIe Salon International de Photographie de Belgique.—Entries, April 1; open, May–October, 1938. (J. Lejeune, 70, Avenue Van Becelaere, Boitsfort, Brussels, Belgium.)

A photographic club has recently been formed in Springs, Transvaal, South Africa, known as the Springs Camera Club. A programme of lectures has been drawn up, and competitions will be held at intervals. Meetings will be held fortnightly at members' homes, and the Hon. Secretary, Mr. Geo. H. Hewgill, can be interviewed at the Central Pharmacy, Third Street, Springs. Amateur photographers wishing to avail themselves of the privileges of membership should call on the Hon. Secretary at the above address, or write to him c/o P.O. Box 89, Springs.

Mr. R. L. Knight, Artist and Photographer, 74, Boutport Street, Barnstaple, informs us that he has had the following cameras stolen from his premises: One Compass Camera, No. 2597-953, and one Baby Rolleiflex Camera, 4×4 cm., f/2.8 lens, No. 158775. Will any readers who may be able to help in tracing the missing goods please communicate with Mr. Knight at the above address.

"**Ars Photographica**" is conducting, under the supervision of the municipal officials of Brussels, a lottery the proceeds of which will be devoted to the creation of a Museum of Photography as a new department at the Musées Royaux d'Art et d'Histoire. The prizes offered amount to a total of half a million francs.

The Ilford Photographic Society will be holding an International Exhibition of Photography at the Super Cinema, Ilford, from the 7th to the 12th of March, 1938, inclusive. The Judge on this occasion will be Mr. W. L. F. Wastell. In the Open Class there are three sections, (1) Advanced, (2) Miniature, and (3) Beginners. In the Members' Class there are five sections, (1) Advanced, (2) Intermediate, (3) Beginners, (4) Portrait and (5) Record. Two competitions are being run concurrently with the exhibition, which are for members only, and these are classified as O.—Outing Competition, for pictures taken on the Society's outings during 1937 and 1938,

and E.—Essex Landscape Trophy for best landscape taken in the county of Essex. The closing date for entries is January 31st, 1938, which should be sent to the Exhibition Secretaries, 11, Woodlands Road, Ilford, Essex.

The Brussels International Salon of Photographic Art will be open from April 23rd to May 8th, 1938, at the Musées Royaux d'Art et d'Histoire, in the Avenue des Nerviens. On this occasion the society "Ars Photographica" will acquire some of the exhibited works and will distribute them by lot to visitors to the Salon. Entry free (except Fridays), from 9.30 to 12.30 and 2 to 5 p.m.

Amateur photographers in the Prestwick district should take note that there has been a change in the secretaryship of that club, the new Secretary being Mr. Hector Lawson, 26, Ayr Road, Prestwick. Mr. Lawson will be pleased to send particulars of the Society to any in the district who may be interested.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Thursday, December 2nd.

Ayr P.S. Whist Drive.
Accrington C.C. General Meeting and Supper.
Armsley and Wortley P.S. "Round About a Yorkshire Village." T. G. Askew.
Ashton-under-Lyne P.S. Criticism of Exhibition Prints by A. H. Green.
Aston P.S. Enlarging Night.
Bayswater and Paddington P.S. "Pictorial Landscape." J. H. Clark.
Birmingham P.S. "Composition." Frank Smythe.
Blyth and D.C.C. Members' Prints (Children).
Bolton C.C. "North Devon and West Somerset." Mr. Travis Burton.
Bromley C.C. "Light Filters and their Uses." J. Ainger Hall.
Bury P.S. Social Evening.
Camberwell C.C. "Modern Aids to Indoor Portraiture."
Coatbridge P.A. Print Criticism Night.
Derby Railway Inst. P.S. "This England." R. Harley-Smith.
Gateshead and D.C.C. Practical Criticism. H. E. Galloway.
Greenock C.C. "Holidays with the Camera." D. McDonald.
Hampshire House P.S. "Sea Land Seen Again." G. H. Dannatt.
Herefordshire P.S. "Pictorial Photography and Composition." F. Green.
Huddersfield N.P. and A.S. "Hills and Dales of Derbyshire." S. Greenwood.
Hull P.S. "Record and Architectural Photography." J. Crowther Cox.
Isle of Wight C.C. "Cinema Films." F. W. Beken.
Keighley and D.P.A. "Heart of Lakeland." W. E. Palmer.
Kentish Town P.C. "The Lens."
Liverpool A.P.A. "Some Beauty-Spots of Great Britain." T. Woods.
Loughborough P.S. "Composition Simplified." E. A. W. Cave.
Manchester A.P.S. "The Italian Lakes and Dolomites in Colour." L. Barrow.
Medway A.P.A. "A Chat on Lenses." A. J. Saturley.
Motherwell Y.M.C.A. C.C. "At Home."
Nottingham and Notts P.S. "5,000 Days at the Zoo." J. E. Saunders.
Oldham P.S. "Composition." S. Bridgen.
Oxford P.S. Joint Meeting with Oxford Cage Bird Society.
Padiham and D.P.S. Print Night.
Runcorn C.C. "Mid England." W. Woodbridge.
Singer C.C. G.D.U. Lantern Slides and S.P.F. Colour Slides.
Smethwick and D.P.S. Alliance Slides.
Sunderland P.A. Lecture. Dr. L. A. Sayce.
Wakefield and D.C.C. "Composition." P. S. Colledge.
Watford C.C. "Between France and Spain." P. B. Dannatt.
Welfare C.C. "Faults in Negatives."
Wimbledon C.C. "Modern Roll Film." Dr. Beilenson.
Woolwich P.S. "Things Seen and Screened." A. R. Thomas.

Friday, December 3rd.

Bethnal Green C.C. "Some things seen in Holland." W. Rawlings.
Blackburn and D.C.C. Dorothy Wilding's Portfolio.
Bristol and W. of England P.S. "Tone Reproduction." R. Smith.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Our Publishers inform us that the new volume of *Photograms of the Year* is now ready, and will be on sale at all booksellers and bookstalls this week, or may be obtained direct from the office of this paper, Dorset House, Stamford Street, London, S.E.1. Prices are, 5s. paper covers, 7s. 6d. cloth bound, postage 6d. extra if obtained from the publishers direct. A full review of this popular annual will appear in our Christmas Number next week.

A winter snapshot competition that will appeal to a great number of our readers has just been announced by Messrs. R. F. Hunter Ltd., 51, Gray's Inn Road, W.C.1, who are the sole concessionaires for the new miniature focal-plane camera, the "Purma Special," which sells at 50s. only. By means of this camera, which is fitted with a fixed-focus $f/6.3$ anastigmat, slow and high-speed snapshot exposures can be obtained merely by turning the camera itself, the pictures being $1\frac{1}{2}$ in. square, 16 on V.P. film. As the shutter of this camera is remarkably efficient, and the entire instrument is extraordinarily simple in action, winter snapshots with it are a matter of extreme ease, and to encourage the production of pictures taken with the "Purma Special," £100 in prizes are being offered—first prize £50, second prize £20, and four prizes of £5 each—in a simple competition, which will remain open until March 31st, 1938. Full particulars and entry forms are obtainable free on request from dealers, or from R. F. Hunter Ltd. at the above address.

The Service Company, Ltd., of 289, High Holborn, W.C.1, have just published a catalogue including a selection of ciné cameras and projectors, together with ciné accessories of all types. This catalogue, entitled "Home Movie World" will be found of considerable value by amateur cinematographers, to whom a copy will be sent on application to the above address.

We are asked by the Miscellaneous Trading Co. Ltd., to draw attention to the fact that they have removed to 135, High Holborn, W.C.2, their premises being the site of the old British Museum Tube Station, which has been converted into an attractive shop and showrooms. The telephone number is still Holborn 4894.

A number of amateur photographers in Putney and Fulham are endeavouring to form a club, to be known as The Putney Camera Club, and the organising secretary is anxious to get in touch with any intending members in the district. If those interested will communicate with Mr. W. Holroyd, 26, Putney High Street, Putney, S.W.15, full particulars regarding arrangements will be sent them.

Messrs. Kodak Ltd. have just brought out, under the title "Ciné-Kodagraphs" a list of professionally-made motion pictures on 8-mm. and 16-mm. film. Owners of projectors of these sizes will find in the list many films that will interest them, and they can be bought for prices as low as 7s. 6d. Those desirous of receiving a copy of this list should apply to Kodak House, Kingsway, W.C.2, or any photographic dealer.

On November 6th, Mr. H. V. E. Portal, Sulham House, Pangbourne, had his house burgled, and amongst articles stolen was a 6×6 Automatic Rolleiflex in ever-ready case. The number of the camera is 508976, lens No. 1881796 (Tessar $f/3.5$). Two Proxar lenses in a leather case 2×28.5, and a Rolleiflex medium yellow filter were also taken. If any of our readers can assist in tracing the stolen goods will he communicate with Mr. Portal at the above address.

The following current notice has been posted outside all Metropolitan Police stations: "£5 Reward. Lost, on November 8th, 1937, between Dover and 26, Victoria Street, S.W.1, a Magazine Ciné-Kodak Camera, No. 17456. The above reward will be paid by Mr. Harris, of 26, Victoria Street, S.W.1, on the restoration in good condition of the camera."

Mr. A. E. Barratt, 11, Love Lane, Whitby, Yorks, is desirous of starting a photographic society in his home town, which is ideally situated for photographic activity. He has already come in contact with a number of enthusiastic amateur photographers, but would like to hear from others and also receive any ideas on the formation of the proposed society. Will those amateurs in the district who are keen and interested make themselves known at once to Mr. Barratt?

Messrs. Ilford Ltd. have just issued an eight-page brochure on winter photography by day and night, drawing attention to the possibilities offered by Selo Hypersensitive Panchromatic film for outdoor work, and more particularly to the use of this film in conjunction with Selo Lighting Sets for portrait and figure work indoors. Useful suggestions as to lighting and exposure are given, but even fuller information is contained in the Ilford-Selo book "Night Photography," which, like the brochure itself, is obtainable gratis from any photographic dealer or will be sent post free on application to Messrs. Ilford Ltd., Ilford, London.

This week's winner in the Wallace Heaton "Indoor Portraits and Figure Studies" Competition is Mr. Fritz Borst, Schönbach b. Eger, Czechoslovakia, to whom the award of one guinea has been made for his portrait entitled "Hildegard." Readers will find full particulars regarding these weekly competitions in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5×3, supplied for card index cabinets.

The collection when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

102. Makers' Formulæ: Developers for Criterion Lantern Plates

M.Q. for Black Tones.

Potassium metabisulphite	20 grs.	(2.5 grm.)
Metol	14 grs.	(1.6 grm.)
Hydroquinone	60 grs.	(7 grm.)
Sodium sulphite (anhydrous)	220 grs.	(25 grm.)
Sodium carbonate (anhydrous)	300 grs.	(34 grm.)
Potassium bromide	2 grs.	(0.2 grm.)
Water to	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 800 grs. (91 grm.).

Gives black tones on Criterion Special and Bygas lantern plates, but if diluted and further restrained will give warm tones also on Bygas plates.

Hydroquinone for Black Tones.

A. Hydroquinone	80 grs.	(9 grm.)
Sodium sulphite (anhydrous)	220 grs.	(25 grm.)
Water to	20 oz.	(1,000 c.c.)
B. Caustic soda	35 grs.	(4 grm.)
Potassium bromide	10 grs.	(1.1 grm.)
Water to	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take double the quantity shown. For use, mix equal parts of A and B.

Gives black tones on Criterion Special and Bygas lantern plates, but if diluted and further restrained can be used for warm tones also on Bygas plates.

For Mezzotone Warm-Tone Plates.

Metol	2½ grs.	(0.3 grm.)
Hydroquinone	45 grs.	(5 grm.)
Sodium sulphite (anhydrous)	110 grs.	(12.5 grm.)
Potassium metabisulphite	110 grs.	(1.7 grm.)
Sodium carbonate (anhydrous)	120 grs.	(13.5 grm.)
Potassium bromide	15 grs.	(1.7 grm.)
Water to	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 220 grs. (25 grm.). If crystallised carbonate is used, take 330 grs. (37.5 grm.).

Used as above, gives warm-black tones. Still warmer tones can be obtained by diluting the developer, adding more bromide, and increasing the exposure. Development should be carried out at 65° Fahr. (18° C.).

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Staniford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Hand or Stand?

In lists of "Permits to Photograph" a distinction is often drawn between hand cameras and stand cameras. What types come under the head of "Stand Cameras," and would the use of a light collapsible tripod make any difference?

J. E. G. (Maidenhead.)

For the purpose of permits it is not necessary to attempt to make any distinction between a hand camera and a stand camera. Whatever the make or type of the camera it counts as a hand camera if you use it in the hand; if you put it on a tripod it becomes a stand camera for the purposes of the regulations.

Sensitised Christmas Cards.

Can you tell me where I could obtain Christmas greeting cards with a space sensitised for printing upon?

E. C. (Chalfont.)

We do not know of any firm that sells Christmas greeting cards with a space sensitised for printing upon. Cards of this type are best prepared by yourself from a composite negative, consisting of the greeting written or printed on celluloid and combined with the negative, portrait or otherwise, that you wish to print. If the usual type of Christmas card or folder in which a print could be mounted would meet your case, we suggest that you apply to Messrs. Marshall & Co., Ltd., Photo Works, Nottingham or any one of several other firms whose advertisements can be found in these pages.

Fog-Streaks.

The enclosed negative shows a streak of fog across it. Three only of a six-exposure roll have this fault, so I suppose the camera cannot be blamed, especially as the only opening in the back (the red window) is at the opposite end from the fog. But as it does not extend to the edge of the film it cannot arise from loose rolling. Can you suggest the cause?

J. I. J. (Wexham.)

It is pretty evident from your films that light is leaking into the back of the camera, but if you cannot trace the leak yourself by holding the film in

position in the camera, we can only suggest that you send your camera with some sample films to a repairing firm, who will no doubt be able to locate and remedy the trouble. The fact that the fog only appears on some exposures is doubtless connected with the length of time they are left in position in the camera or the brightness of the light to which the camera is exposed.

New Lens on Reflex.

I have recently had a new lens fitted to my reflex, and have to recalibrate the focussing scale. How can I calculate the position for "Infinity"? Or should I use the setting for the hyperfocal distance? And, if so, how do I find that?

S. T. (London.)

Have you been using the top screen as a view-finder only? If so, you have missed the whole point of the reflex camera, which is that when the image is sharp on the top screen it is sharp on the plate, so that you normally do not need a focussing scale at all. But if you would like to have one, all you need do is focus on a series of objects at known distances, and mark the position of the lens-front that gives sharp focus for each.

Photographs for Reproduction.

All books on press photography and kindred subjects say that prints sent to newspapers or magazines for reproduction must be on glossy paper. Why is it that only glossy prints can be reproduced?

J. L. B. S. (S. Africa.)

The only answer we can give to your question is that it is not a fact that only glossy prints can be reproduced. A glossy print is preferred for this purpose partly because the surface is grainless and partly because the total range of contrast on such paper is greater, but where necessary blocks can perfectly well be made from semi-glossy, matt, or even rather rough papers. Quite a number of the illustrations in "The A.P." are made from matt prints, especially those on the centre Art pages.

Fitting a Lens.

I have an old "Detektiv Aplanat" f/6 lens from a quarter-plate camera, and I am going to fit it to a 3½ x 2½ box-form roll-film camera. How can I calculate the correct distance that it should be from the film? It is a 5-in. lens; does this mean it must be 5 in. from the film? And if so, from what part of the lens do I measure?

H. R. M. (Redhill.)

Your question cannot be answered definitely. It is most probable that the measurement will have to be taken from somewhere near the iris diaphragm, but you will have to arrive at the exact position by means of a focussing screen, which you must place in exactly the position to be occupied by the film. Your letter rather suggests that you have failed to realise that any one setting of the lens can only be correct for objects at one distance from the camera; with an f/6 lens, you will quite certainly need a focussing adjustment. The duty of this is to carry the lens forward to the correct extent when photographing objects nearer than some 50 ft. from the camera.

An Unimportant Difference.

What difference in performance is to be expected with a camera fitted with an f/4.5 lens as compared with one fitted with an f/4.8 lens?

W. G. P. (Bristol.)

Other things being equal, the only difference would be one of speed. As the exposures required are in the ratio of the squares of the f/ numbers, the relative exposures would be 20.25 as against 24.04. If an exposure of 1 sec. was necessary with the f/4.5 lens, the f/4.8 lens would require about 1.1/5th sec. This difference in speed is completely negligible; if you gave two films the same exposure, one through each lens at full aperture, you would not be able to tell by comparing them which had been taken with which lens.

What does an Ounce Weigh?

When making up developing and other formulae, should I use apothecaries' or avoirdupois ounces?

W. T. (Swindon.)

In most modern formulae the ounce used is the avoirdupois ounce of 437½ grains, because when you buy chemicals this is the weight used. Older formulae, however, often used the apothecaries' ounce of 480 grains. In formulae published in "The A.P." the avoirdupois ounce is meant, but wherever confusion between the two would result in an error large enough to matter we make a point of giving the weight in grains, even though this sometimes leads to inconveniently large numbers. The reason for this is that the grain is the same in both apothecaries' and avoirdupois weights, so that no possible confusion can arise.

Glazing Prints.

How can I get a perfect glaze on prints? I have tried chromium, glass and ferrotype plates, and have used a glazing solution, but in all cases the prints turn out to be covered with minute patches of roughness.

R. C. (Hyde.)

From the last sentence in your letter it is evident that you are not squeezeegeeing the prints into sufficiently close contact with the glazing slabs. The rough spots are caused by imprisoned air-bubbles.

... A NEW SERVICE FOR CINÉ ENTHUSIASTS

EXCLUSIVE TO R. G. LEWIS (CINÉ) CUSTOMERS

Now—when you purchase a projector from R. G. Lewis (Ciné) you get free maintenance for a period of 2 years (a free overhaul every six months). In addition to this helpful service we will install talkie apparatus free of charge anywhere in England or Wales; this includes sending an experienced operator to instruct in the use of the apparatus if required.

INVEST IN A SOUND PROJECTOR !

Let us show you the New FILMOSOUND

Filmo's exclusive side tension film movement minimises film wear. Aerodul cooling preserves the film and keeps the lamp within a safe temperature. A powerful amplifier delivers 5 watts of undistorted sound. Reels holding 1,600 ft. of film, giving a 45 minutes' continuous show, may be used. Price, complete, £134 0 0

SECOND-HAND CINÉ CAMERAS AND PROJECTORS WITH A FULL GUARANTEE FOR SIX MONTHS

8-mm. PROJECTORS.

8-mm. Eumig P.III, 250 watts, air cooled, 2.5-cm. Meyer Kinon projection lens, motor speed control, quick-feed sprockets, built-in resistance, geared hand rewind. As new.....£14 10 0
Kodascope Model 3/35, 200-watt lamp, built-in resistance for 230 volts, 1-in. projection lens. New. Shop-soiled only £8 15 0
8-mm. Bell & Howell, 400-watt lamp, geared drive, rewind, stills, complete with case. As new.....£33 10 0

9.5-mm. PROJECTORS.

9.5-mm. Pathe Luxe, 32-mm. projection lens, motor speed control, complete with resistance and case. Excellent condition.....£13 10 0
9.5-mm. Pathe Imp. motor, super attachment and resistance. Excellent condition.....£4 10 0

16-mm. PROJECTORS.

16-mm. Zeiss Ikon, 800-ft. model, 375 watts, air-cooled, 5-cm. f/1.4 Allnar anastigmat, brilliant flickerless picture, speed control, projector is housed in permanent casing which deadens noise when running, complete with transformer. As new £62 10 0
16-mm. Kodascope Model D, 300 watts, air-cooled, 1 1/2-in. projection lens, stills and automatic rewind, complete with resistance and case. As new.....£13 10 0
16-mm. Kodascope Model A, 200 watts, 2-in. projection lens, motor speed control, ammeter control to lamp, hand geared rewind, complete with resistance. Nice condition.....£12 17 6
16-mm. Ampro, 750 watts, air-cooled, forward, reverse and rewind switch, stills, separate lamp switch, motor regulator, ratchet tilting adjustment, 2-in. f/1.65 projection lens. In excellent condition, complete with 400-ft. reel and case.....£37 10 0
16-mm. Ampro, 500 watts, air-cooled, description as above.....£32 10 0
16-mm. Kodascope Model C, 100 watts, motor drive with rheostat control, stills, 2-in. projection lens, complete with resistance and case. In good order.....£8 17 6

8-mm. CAMERAS.

8-mm. Cine-Kodak Eight, f/3.5 Kodak anastigmat, optical finder and footage indicator. As new.....£6 17 6
8-mm. Cine-Kodak Eight, f/2.7 Kodak anastigmat, optical D.V. finder and footage indicator. As new.....£8 17 6
8-mm. Bell & Howell Straight Eight, f/2.5 anastigmat, 4 speeds, interchangeable lens fitting, automatic footage indicator. Excellent condition.....£9 17 6

9.5-mm. CAMERAS.

"Photograms of the Year" has grown in popularity with the passing years. The volume for 1938 will be the forty-third annual issue and will increase the prestige which this outstanding compilation has won throughout the world for its wide range of subjects, their technical excellence, and the quality of reproduction. It will contain examples of the best work of the world's foremost camera artists, specially chosen by Mr. F. J. Mortimer, Editor of "The Amateur Photographer."

Keen Photographers will welcome the opportunity afforded by "Photograms" of viewing the finest and most modern expressions of photographic art, and of observing the latest technical developments.

The volume will contain an editorial résumé on "The Year's Work," and contributions by well-known writers in many foreign countries. Critical notes of the photographs, and an up-to-date Directory of British Photographic Societies will also be included.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 280, Deansgate, Manchester, 3; 268, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

DOLLY, f/2 Xenon, 16-on-V.P., £8; also Busch 22½-in. Telephoto f/7, offers. Wanted, Exakta B.—Worthy, 4, Knights Park, Kingston-on-Thames. [9765]

Brighter Photography

By DAVID CHARLES, F.R.P.S.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. There are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing, and over one hundred and sixty illustrations, each numbered and each conveying a really useful hint.

EITHER — OR ?

INDECISION, DOUBT—FLEE !

YOUR ATTENTION IS ATTRACTED TO A CAMERA THAT HAS NOT HAD A FAIR SHARE OF LIMELIGHT UP TO THE MOMENT.

Contax I has been withdrawn for various reasons, and the NETTAX comes into the front rank of coupled range under 35-mm. cameras, standing shoulder to shoulder with Contax II and III and their rivals.

With interchangeable lenses, very rapid focussing and metal focal-plane shutter speeded 1/5th to 1/1,000th; detachable back and all the finish of a Contax, we think this camera represents extremely good value. If you want a miniature outfit, we shall be very pleased to discuss points, and perhaps save you unnecessary expenditure.

NETTAX

F/2.8 Tessar... £32 0 0
F/3.5 Tessar... £29 10 0

ALL CONTAX MODELS IN STOCK. The finest camera made for the user of wide-aperture lenses. We are making unusually good allowances for any other modern apparatus against Contaxes during the period of this advertisement.

DOLLONDS
DOLLOND & AITCHISON LTD. ESTD. 1750

Wallace Heaton reminds you that . . . IT'S ONLY 4 WEEKS TO CHRISTMAS!

"Four weeks—not very long to do all you'd like to do before the big occasion arrives. Personally, I like to start catering in good time for the festive season—it's so much more enjoyable to be able to choose your purchases at leisure—a last-minute hectic rush is invariably the cause of someone or something being forgotten. At my shops, for instance, or rather those under my control, you will find a complete stock in preparation for Christmas buying, and it must be good to know that on my two-year payment system you will be able to buy more and better apparatus. It's just friendly advice when I say 'start shopping now'—the Tubes are quieter, the streets are not over-crowded, and there's room to move in the showrooms. If you live out of Town, write to me personally—I will see that you get 'shop-counter service' by post."

Wallace Heaton

Are YOU Having HOME TALKIES?

Then it will interest you to hear the latest models in our demonstration theatre. We thoroughly recommend the

FILMOSOUND 138

The entire machine is contained in a single case, which also accommodates a 1,600-ft. reel of film, giving 15 minutes' show without a stop. In use, the combined projector and amplifier unit is removed from the case, of which the cover serves as the baffle for the self-contained loud-speaker. Voltages on exciter lamp and photocell are balanced automatically as the volume control is changed. New type of tilt device, operated by one hand. £138
Motor rewind . . . Cash

10 SEPARATE LISTS

Minicams, Accessories, Cine Apparatus, Used Bargains, D. & P. Services, Enlargers, Film Library (a separate list for 9.5-mm. silent, 16-mm. silent and 16-mm. sound-on-film). Get the one you want to-day.

FREE FOR 2d. POSTAGE.

OR BETTER MOVIES WITH A MORE UP-TO-DATE PROJECTOR?

We have every model including Bell-Howell, Siemens, Kodascope, Coronet, Keystone, Dittmar, etc. Here is the

SIEMENS "SIXTEEN-NINE"

Takes 9.5 and 16 mm. films. Has 200-watt lamp, speeds 12 to 28 pictures per sec., motor rewind, single picture device. Silent take-up. Simple threading. Self-contained resistance. Centring device and safety switch. You can't go wrong in choosing Siemens.

Cash price £59 : 10 : 0

24 monthly payments of 53/4.

THE FIRST MONTHLY INSTALLMENT GETS YOUR PURCHASE—NO DEPOSIT TO PAY.

FILMO "EIGHT" PROJECTOR

400-watt illumination—through perfected optical system employing fast f/1.6 lens, gives clear brilliant 8-mm. pictures on 6-ft. screen. Made for use with Filmo "8" Cameras, fully gear driven.

Cash price £41 : 0 : 0

24 monthly payments of 36/9.

MORE PROJECTOR SUGGESTIONS ON OUR 2-YEAR PAYMENT PLAN

Coronet 9.5-mm.	24 monthly payments of 13/7
Kodascope "EE" 16-mm.	24 monthly payments of 29/2
Keystone 16-mm.	24 monthly payments of 24/8

For Roll Film Cameras

SELO
HYPERSENSITIVE
PANCHROMATIC
ROLL FILM

For Plate Cameras

ILFORD
HYPERSENSITIVE
PANCHROMATIC PLATES

Photography doesn't end at sunset these days. Unique opportunities for unusual snapshots wait for you now after dark. Simply load your camera with SELO Hypersensitive Panchromatic Roll Film or Ilford Hypersensitive Panchromatic Plates—and picture-making by night becomes at once as "easy as daylight." Whether it's the lamp-post in the village street or the brilliant illuminations of a seaside promenade, you will get equally fine and *original* results—so outstanding is the speed of these remarkable plates and films. At home, also, you can have great fun making portraits of your family and friends—as well as snapping many gay incidents of domestic life.

Made in England by
ILFORD LIMITED, ILFORD, LONDON

Leica

THE PRESENT FOR THE FUTURE

A gift you will be proud to give to those whom you hold in the highest esteem. In its handsome gift box, and with its own beauty of form and appearance the Leica meets the need for an attractive gift while at the same time it is eminently practical and useful. It will bring increasing pleasure to the recipient for the rest of his life. With no other gift could more, or as much, be claimed.

"Leica News and Technique," a bi-monthly illustrated journal, distributed free to all Leica users in Britain who register their camera number with us. A specimen copy is gladly sent free on request.

Ask any good class dealer for a demonstration, or write for full descriptive literature to:

KODAK

NEWS

Weather on Tap

In the Kodak Research Laboratories at Wealdstone, Middlesex, it is possible to reproduce the atmospheric conditions of any part of the world, from the humid heat of the tropics to the dry cold of the far north. Double doors and windows, cork linings to walls, ceiling and floor, and an elaborate air-conditioning plant enable the most exact atmospheric control to be maintained, so that the effect of various climatic conditions on Kodak material can be studied.

Here, with technical equipment on a scale only made possible by the size of the Kodak organisation, the most highly qualified chemists and physicists keep scrupulous check on Kodak products, constantly investigating and devising new processes, and constantly improving old ones. Six main laboratories cover the broad fields of chemistry, physics, physical chemistry, photometry and sensitometry. In addition, many other rooms are devoted to specialised

research on photographic manufacture, on emulsion making and on practical photographic processes. Such are some of the resources behind your Kodak Camera, your spool of Kodak Film, your packet of Kodak Paper.

Cash Prize in Wallace Heaton's Competition*

"SPEED & ACTION" PICTURES

Pick out your best shots of car-racing, steeplechasing, hockey, diving, etc., and send them in at once. There's a big cash prize waiting for the amateur who submits the best effort. You may use any camera you like, and we leave the choice of materials entirely to you. There's no admission fee, so enter at once. All efforts will be judged on their value as "speed and action" pictures combined with good photography.

NO ENTRANCE FEE AND THE RULES ARE SIMPLE

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA or MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE MOUNTED OR UNMOUNTED (not less than 8×6 unmounted is recommended). WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning Photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry.

The current series of competitions ends on December 31st, all entries for "Speed and Action" Pictures are eligible for weekly prizes as well as the final £25 prize. All entries for previous subjects in the present series can now only go forward for the final judging for the £25 award.

Last week's prize-winner: Mrs. GOLDRING, Timberscombe, Fernhurst, Haslemere, with picture entitled "HAROLD BEETON," in "Indoor Portraits and Figure Studies."

SUGGESTIONS for GIFTS!

A Camera—it need not be very expensive—makes a particularly pleasing gift to one who has yet to take up amateur photography as a stable pastime. Or, to one who has already joined the great fraternity—or that of the ever-growing numbers of 'home-cine' enthusiasts—there are any number of accessories and 'gadgets' from which you can make a choice—at the WESTMINSTER.

And *always*—remember the WESTMINSTER for magnificent stocks, most thoughtful service, and the easiest and *friendliest* 'Out-of-Income' Plan.

"ALTIFLEX"

THE NEW
TWIN-LENS
REFLEX
OF TRULY
TOPMOST
VALUE

This quite remarkable little camera beats all records for sheer photographic efficiency, at a hitherto unheard-of price. A typical WESTMINSTER opportunity. Takes 12 pictures 2½ in. square on normal 120 film. The full-size finder with magnifier allows of needle-sharp accuracy in focussing, and that with the greatest ease, as close as 3 ft.; delightfully smooth and certain lever action. Unique and positive exposure counter. All-metal body, with fine leather covering. With Super f/4.5 Victor anastigmat and special Automat shutter, giving 4 speeds and Time exposures. A most attractive and dependable camera for expert and beginner alike. Write for full description, or call and see it at the Westminster as quickly as you can.

Price £5:12:6

12 monthly payments of 9/10.

● Obtainable only from
the WESTMINSTER

WESTMINSTER 'VICTORIA'—2.9 Lens

Let your acumen be praised!

If you pride yourself on the right present for the right person, here's a suggestion for your friends who are keen photographers. More — it's a gift that non-photographers will equally appreciate; it will open up a new world to them.

Compass, the miniature camera that is a pleasure to look at and a delight to handle, holds untold possibilities for its fortunate possessor. The first glance will bring praise for the wise donor and when it is seen how simple it is, for expert and novice alike, to take good photographs, Compass will prove a constant companion — an ever present reminder of your thoughtfulness.

The Compass Camera may be seen at Appointed Compass Dealers or at the Company's Showrooms

● You are invited to write for a 48pp booklet

The NEW ROLLEIFLEX

THIS

With its clean sleek lines, is a present of great distinction. Space does not permit a complete specification, but these revolutionary features indicate its improved efficiency. Automatic film wind that sets the shutter, prevents double exposures, and sets self-timer for delayed action (if required). Automatic exposure counter without use of red window. After the twelfth exposure the film is automatically released. F/2.8 finder lens. Improved controls. Cylinder lens over peep-window shows shutter speeds and lens apertures in magnified form. New eye-level focussing. Combined depth-of-focus and focussing knob. Zeiss Tessar f/3.5 lens. Compur Rapid shutter, speeded to 1/500th sec. and Bulb with 12 secs. delayed-action device. All the other famous Rolleiflex features are maintained.£31 5 0

Ever-ready case, £1 17 6

OR THIS

The ROLLEICORD Model 1A

A versatile model at a popular price. It takes 12 pictures on $3\frac{1}{2} \times 2\frac{1}{4}$ 8-exposure roll film for 1/-, and shows the picture full-size and right way up on the ground-glass focussing screen, with full provision for parallax compensation. Automatic film wind makes overlapping exposures impossible. Zeiss Triotar f/4.5 lens and Compur shutter, speeded to 1/300th sec., T. and B.£12 10 0

AND THIS

The ROLLEICORD Model 2

This proved favourite will satisfy the most fastidious. It is standard size and takes all the Rolleiflex accessories, except only the angle mirror, and can also be adapted for plates or 35-mm. film. Its fast f/3.5 Zeiss Triotar lens makes it ideal for night and artificial light photography. Compur shutter speeded to 1/300th sec., T. and B.£16 10 0

The finest present you could possibly give . . .

VICTOR II THE HOME CINÉ TO BRING JOY TO THE WHOLE FAMILY!

Its performance excels that of projectors previously selling at twice the price. It has 4-point film protection. Victor's patented film trip, constantly on guard at all loop positions, automatically "kicks" operating lever into non-operating position before film damage can occur in any film emergency. Super Hi-power illumination. Super-efficient cooling. Four-in-one control for operation. Forward, reverse, and still picture devices. Cool running motor. Rack-and-pinion focussing with integral mechanical framer. Pilot light, lamp and motor switches, positive, full-range tilt, 2-way rapid rewind, etc. Standard lamp equipment is the 500-watt T-10 Mazda, but it will accommodate lamps of other wattages, including the powerful 750-watt. Weighs only 13 lb. Price With 500-watt£42 0 0 With 750-watt.....£42 5 0

We notice that some of our trade friends are just beginning to realise the importance of Personal Service. Old customers of ours know that this has always been one of the chief features of our business since we commenced trading in a small way many years ago, and we are confident we owe our continued success mainly to this, and our endeavours to make all customers perfectly happy over every transaction.

All of us at A.C.S. Ltd. have our own personal customers, and whether you see me or one of our fully-qualified staff you will receive that cheerful individual attention that characterises our service to the discriminating amateur or movie-maker who wants unbiased advice, instruction and service with his purchases.

Bedson

MUSHROOMS GROW IN A NIGHT—

but our business has been built by years of unflinching service. Every deal makes a satisfied customer, and Mr. Click symbolises our cheerful personal attention to all orders whether large or small.

Christmas Present Suggestions

No time to think—but ROBOT

"THE CAMERA THAT THINKS FOR YOU"

That's the big thing about a "ROBOT," it **never** misses a picture. How could it with 24 exposures ready set—just to shoot off as quickly as you can press the button. No "doubles" or "overlaps" either. And the "Zone" focussing—needle-sharp pictures every time. Filter too, if you want it, that automatically compensates exposure. Little wonder that the pressman, the exhibitor, club man and the holiday-maker alike are going over to "ROBOT." Write for full details of the 20 **exclusive** advantages.

British Made

The
AVO PHOTO-ELECTRIC EXPOSURE METER

The simplest exposure meter yet produced. Tells you at a quick glance the correct aperture or shutter speed to use for the light prevailing at the actual moment of taking the photograph.

- Unique method of exposure indication. No confusing scale to decipher.
- Indicates exposures from 60 secs. to 1/2,000th of a sec.
- Influenced only by the light actually received by the camera.
- Size 2½×2½×1 in. Can be held and operated in one hand.
- Universal; for Still or Cine Cameras.

Price **63/-** Ever-ready case, as illustrated, 5s. extra.

FROM LEADING PHOTOGRAPHIC DEALERS

... a real aid to better photography—a gift that gives the assurance of successful pictures—get one of these "AVO" Exposure Meters for Xmas.

SMETHURST High-Light EXPOSURE METER

Designed specifically to ensure uniform image quality in Ciné work. Employs new principles, more scientific and more accurate than employed hitherto.

- Revolutionary method of exposure measurement. Readings taken on an artificial high-light embodied in meter.
- Readings ensure uniform image quality throughout every film, and perfect colour rendering in Colour Ciné Work.
- Instantaneous indication of correct aperture for perfect results.
- Enables daylight and artificial light shots to be mixed on same film.
- Ensures success in "effect" shots and "effect tiling."
- Simple to use. No confusing scale to read.

BRITISH MADE

Size 2½×2½×1 in. Complete with Instruction Booklet in ever-ready case fitted with carrying cord..... **4 gns.**

LENSES & CONDENSERS

NEW ENLARGING ANASTIGMATS

We have purchased a large stock of brand new "VICTOR" anastigmat lenses by Messrs. Ludwig of Dresden. These lenses are all in normal iris mounts as illustrated. The iris leaves are metal. The "stops" are marked down to $f/16$. Each lens mount is finished in black enamel, and is fitted with detachable flange. These lenses were designed for enlarging purposes, and we have tested and can recommend them.

Focal length.	Aperture.	Covering.	Power.	Price.
2 in.	$f/4.5$	3×4 cm.		£1 7 6
2 in.	$f/3.5$	36×24 mm.		£1 12 6
3 in.	$f/4.5$	$2\frac{1}{2} \times 2\frac{1}{2}$ in.		£1 12 6
$4\frac{1}{2}$ in.	$f/4.5$	$3\frac{1}{2} \times 2\frac{1}{2}$ in.		£1 16 0

"OPTIS" LENSES

Good quality anastigmat lenses by Optis, Paris, covering $3\frac{1}{2} \times 4\frac{1}{2}$ at full aperture.
Type A, $4\frac{1}{2}$ -in. $f/4.5$, without iris, in mount, as shown..... £1 8 6
Type B, $4\frac{1}{2}$ -in. $f/6.3$, in Dax shutter (with iris), $1/250$ th, $1/500$ th, $1/1000$ th, B., T..... 10s. 6d.

The New VERTICAL "Quickset" ENLARGER

SPECIFICATION.—British-made Vertical enlarger, with 40-in. steel column upon which the lamphouse slides very smoothly, being held rigid in any desired position by a simple locking device. The column is firmly bolted to a large baseboard (19 x 17 in.) which is doubly strengthened with cross-battens. The all-metal lamphouse is of double construction and well ventilated, and is fitted with two $4\frac{1}{2}$ -in. Plano-Convex condenser lenses which ensure even illumination, provided by a 100-watt opal lamp. A mahogany negative carrier is supplied to take negatives of all sizes (glass or film) up to $3\frac{1}{2} \times 2\frac{1}{2}$ in. The standard lens fitted is the Ludwig "Victor" $4\frac{1}{2}$ -in. $f/4.5$ with iris diaphragm, fine focussing being effected by a smoothly working spiral. From a $3\frac{1}{2} \times 2\frac{1}{2}$ negative any size enlargement can be made from about postcard size to 19×14 in., etc. The whole instrument is well finished in black and nickel, with a ruled white sheet on the baseboard and two yards of flex with bayonet plug. The needle-sharp definition of the Victor lens ensures perfect reproduction, even at the greatest degree of enlargement.

"Photograms of the Year" 1938

WHEN a volume has attained its forty-third year of publication it has clearly outlived the necessity for introduction to the public, or anything elaborate in the way of review. "Good wine needs no bush." From a humble origin *Photograms of the Year* has steadily evolved into the most interesting and valuable annual of its kind. Its appearance is awaited, year by year, by photographers the world over, and the whole edition is absorbed as soon as it is created.

A careful study of the present volume reveals the gratifying fact that it definitely maintains its own high standard—and that is praise indeed. Most of those who compare it with previous issues will agree that it has never been surpassed, and that the collection of pictures is in every way a remarkable one. A great proportion of them are the work of those whose names have long been familiar in well-informed photographic circles; but there are also new-comers whose work easily stands comparison with that of the "old masters."

Every distinct type and class of pictorial photography is represented by examples that are an inspiration to those whose tastes lie in the same directions. We all know the marvellous perfection of modern technique, and that is seen at its best here; but in addition there is the more difficult achievement of originality of outlook and treatment that results in extraordinary vitality and freshness throughout the volume. The

selection of the examples reproduced indicates a wide and discriminating outlook, and this has given us the best of the best. More than that could not be done.

In addition to a fine frontispiece of H.M. King George VI there are over eighty pictures reproduced by a special process that emphasises the best points of each picture, and it is no exaggeration to say that every single one deserves the most careful examination and study. The critical remarks on them are also worth study; and there is great interest in the accounts of the present position of photography in the countries in which it is most practised. Mr. F. J. Mortimer, the editor, presents a comprehensive survey of the year's work at home and abroad.

Another very valuable feature of the book is to be found in the complete and detailed lists of photographic societies in the British Isles, including record and survey societies, Alliances and Federations, postal camera clubs and amateur cinematograph societies.

It is the ideal gift book for every photographer at this time of year, and readers of "The A.P." should hasten to secure their copies without delay.

Photograms of the Year is obtainable from all book-sellers and bookstalls, or direct from the publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1, price in stiff paper covers, 5s.; in cloth boards, 7s. 6d., postage 6d. extra. W.

Photography at the Circus

Special Facilities for Readers of "The Amateur Photographer" and a Christmas Prize Competition.

FOR several years in succession we have published articles dealing with photography at the circus, and by "Circus" we mean the popular Christmas entertainment at Olympia, organised and directed by Mr. Bertram Mills. This has now become a well-established annual event that attracts visitors, both young and old, from all parts of the country.

Unfortunately in the past amateur photography at the circus was not encouraged by the management, and restrictions were placed on the indiscriminate use of cameras during the performances. A special permit had to be obtained before any of our readers could put into practice any of the information given in our articles on the subject.

This year, however, after consultation with the management, the ban has been lifted and our readers can now take their "miniatures" and other cameras (but no tripods or cine cameras) to the circus and photograph to their heart's content during the performances.

In addition to this Mr. Bertram Mills has agreed to offer prizes of £5 5s., £3 3s. and three of £1 1s., for the best photographs taken by amateur photographers during the performances between the opening date, December 22nd, and January 22nd.

Photography can, however, proceed uninterrupted during the entire season, that is until January 27th.

The Amateur Photographer, further to encourage its readers in this competition, will add similar amounts to the prizes if the winners are regular readers of this paper and have affixed to the back of each print sent in a coupon which will be printed in the issues of this paper preceding the closing

ADDISON ROAD ENTRANCE.
Plan of the main seating accommodation at the Circus.

date. The first coupon will be found in the advertisement pages of this issue.

All entries must be received before January 25th.

We publish herewith a plan of the circus, which will provide an indication as to the general arrangement. The best positions in the circus seating for photography are as follows:—

Close-ups.—Front rows of Blocks M, K, Q, E.

General Views.—Any rows in Blocks J, J1, L, L1, B.

The arena lighting is very even, composed of ring-side light, standard and spot-lights.

The Box Office at Olympia is now open, so that seats may be secured in advance.

The judges will be Mr. Bertram Mills and the Editor of *The Amateur Photographer*.

Competitors should note the following points:—

Photographers should not disturb other members of the audience, or make nuisances of themselves.

As all the prints submitted will probably be enlargements from small negatives, the minimum size should be $8\frac{1}{2} \times 6\frac{1}{2}$ (whole-plate).

The right to reproduce any of the competition prints by Mr. Bertram Mills and *The Amateur Photographer* is implied by the entry.

The decision of the judges is final.

All entries to be addressed to The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1, marked clearly on the outside of the envelope, "Circus."

Christmas Present Buying

A topical article giving help upon the subject of Christmas presents. It shows how all can be given a present of photographic character. —*the Solution*

AT the present time of the year most of us are exercised in our minds as to what to give our various relatives and friends as Christmas presents. A present, if it is to perform its function, must fulfil a condition. It must be of some use to the recipient; a constant reminder of the giver, and an indication of his forethought.

There are many presents given each Christmas that are put aside and forgotten. The amateur photographer is in a happy position with regard to this. He is able to give acceptable presents to all his friends that will be certain of appreciation, and at a cost ranging from a few shillings up to as many pounds.

For the Photographer.

There are few photographers whose equipment is so complete that it may not be added to with advantage. In these days of small cameras, with a multitude of accessories, there is plenty of scope for wise giving. Some suggestions are given at the end of this article. There is an opportunity to give the photographer who is possessed of apparatus of the older type a miniature camera, which need not be necessarily of the "de luxe" order, so that he may test the capabilities of this form of photography for himself.

For the Beginner.

The beginner who is possessed of a camera, and who at the moment places his exposed films in the hands of the trade for finishing, can be given an opportunity to do his own work, and possibly become a keen photographer, if he is given a simple outfit containing what is necessary for the development and printing of his own films.

This may include a tank, dishes, chemicals, and printing papers. We have known of cases where such a gift has provided a means for the amateur to carry out his own D. and P., and which has resulted in the addition of an ardent worker to the ranks of amateur photographers. It is safe to say that there are many people who, reluctant to get the necessary but not expensive outfit for themselves, will be glad to receive it, and to make good

use of the apparatus and material provided during the coming season.

For the beginner who does his own work there is plenty of opportunity to make the work easier, to ensure better results, or to increase his scope. Some accessory, a piece of apparatus that will allow of entry into a new field, will be certain of acceptance and future use.

For the Non-Photographer.

There are many people who would be photographers but for the fact that they have no camera. Here is a chance to bestow a useful gift. A small compact film camera that can be the companion on holidays and record the incidents of home life will be received with delight, and will be regarded as a decided acquisition either to the individual or the family. It will incidentally create a new photographer.

The Youngsters.

What to give the young people is always a problem to those who have not seen the range that photography can offer. Almost every boy and girl at school wants a camera. If already possessed of a camera there is the opportunity to give a "better" camera, or some wanted accessory that will prove of use in connection with the camera already possessed. Photographic materials should also be thought of, as these make a rather serious inroad upon juvenile pocket-money, and we have never yet met the boy or girl who has enough material for all the subjects that they wish to take.

If a camera is given a few films should accompany it. It is exasperating to be possessed of a new camera that one wants to try and the shops closed over the holidays.

We are quite certain that gratitude will be accorded to the photographic Christmas present for the youngster, and further, that a camera will be in use long after the most expensive mechanical toy is broken and forgotten.

Books.

One of the best signs of photographic health is to be found in the wish to read all the literature concerning it. Here is an opportunity for a useful gift. A book on some phase of photo-

graphic work will be read with interest, and the photographer whose interest is in the achievements of pictorial photography will cherish and find inspiration from a copy of "Photograms of the Year."

"The Amateur Photographer" Diary should also be thought of as an acceptable "Christmas card," with all the year utility. Should there be a photographer who is not already a reader of "The A.P.," what better Christmas gift than a year's subscription to the journal. It will come as a constant reminder of the giver every week.

Photographs as Gifts.

For those who are precluded from the delights of photography the photographic gift still offers the ideal solution to the present problem. An enlargement, suitably mounted and framed, of a subject in which the recipient has an interest, is a gift with which the personality of the giver is associated. It will be especially prized, if the subject is one suggestive of happy memories, and all photographers have negatives in their possession that make such gifts easy. If the worker cannot undertake this himself, a photographic dealer will carry it through, and the product will be one of which the giver need be in no way ashamed. But this matter should be attended to now, not left until the last minute.

Suggestions for Photographic Christmas Presents.

5/- to 15/-. Box cameras for beginners or youngsters. Exposure meters, light filters, tripods, tripod attachments, lens hoods, developing dishes, print washers, printing boxes, dark-room lamps, negative storage albums or files, print albums, developing outfits, retouching sets, photographic books, "Photograms of the Year."

10/- to £1. Inexpensive cameras, exposure meters, light filter sets, supplementary lens sets, dark-room lamps, home portrait lighting sets, electric immersion heaters for dark-room, outfits for home D. and P.

£1 to £2. Cameras with better optical and shutter equipment, developing tanks, supplementary viewfinders for miniature cameras, masking frame for enlarger, light filter sets, range-finders, cine screens, Photoflash synchronisers, retouching desk, dry mounters, print trimmers, etc.

£2 upwards. Still better cameras, enlargers, extra lenses, photo-electric meters, lanterns, projectors for miniature films, spot-lights.

General. Photographic material, plates, films, papers, colour film, material for trial of Carbro or bromoil process (for experienced workers).

A useful "Buyer's Guide" for photographic Christmas presents will be found on pages 657-660, in this issue.

WINTER LA

By H. T. COMERFORD.

required may be prohibitive. F/4.5 is a useful stop and most of my own photographs of this kind have been taken with that aperture. Needless to say, fast films or plates are best for the same reasons of powder economy. Either 'chrome or super-speed pan. will do. Although I have used roll and pack film for these subjects at times, my own preference is for plates, which can be guaranteed to remain flat and in focus all over at large apertures, and can be de-

A MODERN CHRISTMAS CARD, ESSENDEN, HERTS. S.G. Pan. plate, f/3.8, 70 grs. powder, wall on right acted as reflector for flash.

THE VILLAGE GREEN, BENINGTON. Cottages about 100 yards from camera, Isochrom film, f 4.5, 100 grains powder. Flash 10 yards to right of camera.

WOULD you like to get some night pictures a little out of the ordinary? Right. Then keep a tin of flash-powder handy, and when a good fall of snow takes place sally forth into the darkness in search of outdoor flashlight photographs. It's a very fascinating branch of the hobby, and quite easy when you know how to go about it.

As for subjects, these are plentiful, particularly if you are able to get about by car or bicycle. The country offers the most scope for interesting scenes, and if the snow is newly fallen, with every twig bearing its white covering, almost any lane will provide good pictures. If you know of a pretty village with half-timbered cottages, go to it. There should be material for several exposures. Signposts, gates, trees and other simple subjects that would be passed by in daylight make perfect pictures when snow-covered and taken by flashlight.

Any camera that will allow the lens to be opened for time exposures will be suitable, from a box camera upwards, but a fairly large aperture is desirable if subjects beyond, say, 20 ft. are tackled, otherwise the quantity of powder

THE CHURCH AND POND, LITTLE BERKHAMSTED. S.S. Pan., f/4.5, 30 grs., 10 yards to left of camera. A secondary flash to right would have been useful to lighten shadow thrown on church by tree, and to make the building more distinct.

veloped individually where necessary.

A flash-lamp is useful, but sometimes this can be dispensed with and the powder placed on a piece of tin and stood on a gatepost or even on the ground, and ignited with touch-paper. Generally, however, a flash-point some feet from the ground is best in order that the foreground may be properly illuminated. Flash-bulbs have their uses and advantages, particularly in wind and in a moist atmosphere, and one or two might be carried just in case powder is out of the question, but their cost and bulk count against them for our purpose.

The procedure for taking a flashlight photograph in the snow is quite simple. The camera is set up on the tripod and the subject sighted in the view-finder; there is usually sufficient light reflected from the snow to see by, especially if a direct-vision finder of the wire-frame type is fitted to the camera. Cottage lights and street lamps facilitate the placing of the image.

The amount of flash-powder required is estimated from the exposure table that accompanies the tin of powder and measured out on to the piece of tin or

LANDSCAPES by Flashlight

A New Idea for Picture-Making.

the flash-lamp. (As a guide, about 50 grs. or four scoops will be about right for a subject 15 to 18 ft. from the flash with $f/8$. More powder is needed for greater distances.) A reflector to throw the light forward is an advantage and will save powder. When ready, the lens is opened and the flash given, after which the lens is closed. The flash must be behind the line of the lens (which should be hooded) although it may be let off at some distance from the camera to avoid the flat lighting which results from flashing at camera viewpoint.

For some subjects a subsidiary flash

NEWGATE STREET, HERTS. S.G. Pan. plate, $f/3.8$, 100 grs., 20 yards to left and forward of camera. Lens shielded from flash by a hedge on left.

woollen socks or stockings are called for if the pleasure of the photography is not to be marred by the discomfort of the weather conditions. A vacuum flask comes into its own, too, when hot drinks are not certain to be obtainable.

Another important point: Development should be on the short side or the high-lights of the snow will block up; about two-thirds normal development time is sufficient.

"THE COACH AND HORSES," NEWGATE STREET, HERTS. S.G. Pan. plate, $f/3.8$. About 100 grs. powder. Flash 10 yards to right of camera.

may be used to lighten shadows and show detail on both sides of the objects. The second flash should, of course, be smaller; about half the quantity of powder used for the main light is suitable. Street lamps and even the headlights of passing cars can occasionally be utilised to help the effect, but the latter must not shine into the lens, which should be covered before the lights enter the field of view. The snow acts as an excellent reflector, too, to throw light into the more distant parts.

A small pocket torch for making adjustments to the camera is a useful adjunct. Be careful to keep the warm hand or breath away from the cold lens or it will mist up and may diffuse the image on the plate.

Subjects photographed like this make original Christmas card illustrations. And that reminds me—wrap up well, for it may be cold "hanging about." Stout, water-tight footgear and thick

A STREET CORNER AT HODDESDON. Isochrom film, $f/4.5$. Street lamps plus flash round corner to illuminate inn at back.

Readers' Hints, Tips and Gadgets

AN EFFICIENT FLASH-BULB HOLDER.

THE flash-bulb holder illustrated in the diagram was made from scrap, but has nevertheless proved to be highly efficient and dependable in use. Originally it was built for use with the small type of flash-bulbs which are fitted with a bayonet cap and require an adapter if they are to be used in an ordinary flash-lamp.

The holder proper consists of an aluminium pan costing 6d., having a diameter of $4\frac{1}{2}$ in., a lamp-holder, 9 in. of flex,

a miniature bell-push, a torch battery and a quantity of insulating tape. The lamp-holder is mounted in the side of the pan in the position shown by first of all placing it in the position it is to occupy and drawing a pencil line around the bottom. Care must be taken to allow clearance enough to prevent the

glass of the bulb from touching the bottom of the pan; $2\frac{1}{2}$ in. will be found enough.

A number of small holes are drilled around the circumference shown, inside the pencil line just mentioned, and the centre piece is knocked out. The rough edges are smoothed up with a semi-circular file. The handle of the pan is straightened out until it is at right angles to the body. As the material is soft aluminium this operation is quite simple. The bell-push is then placed on the handle and the position of the fixing holes marked with a pencil. The holes are drilled to take 6BA fixing screws.

The lamp-holder is then wired and the flex brought over to the position occupied by the battery. One end is soldered to the top contact. A short length of flex is soldered to the bottom of the battery, making good contact with the zinc, care being observed not to use the iron too hot for this operation. The remaining two ends, one from the lamp-holder and one from the bottom of the battery, are wired into the push, which can then be screwed to the handle. The battery is firmly taped to the handle of the pan with the insulating tape.

This makes a compact assembly which can be used for a large number of bulbs before a battery renewal is necessary. The polished back and sides of the pan very effectively concentrate the maximum amount of light obtained on to the object or model to which it is directed.

In operation, the lamp is held by the handle with the open front directed towards the object being photographed. The bulb is fired by pressing the push-button. W. A. AGNEW.

DOUBLE PRINTING FOR PORTRAIT GREETING CARDS.

I HAVE recently printed a number of cards with two large-scale heads from different negatives, which necessitated one half of the sensitive surface being protected while each portrait was being exposed. I tried several methods and finally devised the simple gadget here described. It is easily made, is efficient, and gives the minimum of trouble. The size mentioned is for postcard, but it can be applied equally well to all sizes.

A section of a postcard, $1/16$ th in. larger than the exact half, was laid on a sheet of thin black paper, which was then cut as shaded portion Fig. 1. Flap A was now turned over on top of and pasted to the section of card, then B and C treated similarly.

The fitment now appeared as Fig. 2, being not unlike an envelope, with a narrow white strip at E. When in use, an unexposed postcard is inserted under the section of card—that is, between the strip E and small flap D, which latter projection greatly facilitates manipulation, and pushed right home. The exposure is now made on the unprotected portion of postcard F and the fitment reversed to allow printing on the other half.

The portraits so printed may be from a single or two negatives if the same grade of paper suits both. In the latter case exposures for one can be completely run off first before commencing with the second negative, but the exposures must be correctly timed so as to allow the twin portraits to reach the proper density in development at the same time.

I found it an advantage to make a thin black line down the

edge of strip E at G. This clearly defined, in the diffused light of the dark-room, where the protecting card finished. In the completed print the portraits are separated by a thin $1/16$ th-in. white line. J. P. MUNN.

A CHEAP PHOTOFLOOD REFLECTOR.

WHY not make your own reflector now that the indoor season has arrived? First save up some silver paper from your cigarette packets and smooth it out carefully. Then get a piece of good firm cardboard and on it draw a circle with a radius of six to eight inches. Cut round the circumference and out of the circle cut a sector of about 30 degrees. Keep in mind that the wider the angle of the sector the deeper the reflector will be. Then cut a round hole in the centre of the cardboard large enough to take an ordinary

lamp-holder. Get your pieces of silver paper, glue them carefully to the cardboard and allow it to dry thoroughly. Then pull the two sides of the sector or "V" together and fasten them with one or two small brass paper-fasteners (the kind with two prongs which you push through the cardboard and bend over). Now get a lamp-holder and fit it with a length of flex and a plug. Then screw the lamp-holder into the centre of your reflector, clamping the latter firmly by the shade-ring, and the job is complete. T. MILLER.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

Capturing the Christmas Spirit

By HAROLD BURDEKIN.

CHRISTMAS FESTIVITIES.
Two lamps, 1/25th sec. at f/4.

DECEMBER offers great scope for the owners of miniature cameras for depicting the Christmas spirit. No owner of a miniature camera should entertain the idea that December is an off-time for photography. It is quite a simple matter nowadays to take excellent snapshots indoors with the aid of one or two Photoflood lamps. The large-aperture lenses fitted to the modern miniature

cameras make it possible to get a feeling of action in your pictures.

Christmas is a time for family gatherings, and those who are lucky enough to know a family of children will have many opportunities of securing jolly pictures full of the spirit of

CHRISTMAS COOKERY. One lamp and a little daylight, 1/25th sec. at f/6.

It will be found that with indoor pictures the lighting plays a great part in making the pictures live. I hope the following notes will prove helpful for those readers who have not yet tried photographing subjects indoors by the means of Photoflood lamps.

Nowadays there is a desire for pictures with sunny lightings. Artificial light can give us any effect if it is properly mastered. The great advantage of artificial lighting lies in the fact that studies can be taken at all times. Technique can to a great extent be standardised, as when once the actinic value of the light is known, it is

CHRISTMAS PRESENTS.
1/25th sec. at f/5.6. Dull light.

THE SPIRIT OF CHRISTMAS. Contax camera, 8.5-cm. lens, 1/50th sec. at f/2, Panatomic film.

Christmastide. Here are a few suggestions for Christmas studies: Gathering the holly, children stirring the Christmas pudding, bringing home the Christmas parcels, snowballing, tobogganing, Christmas shopping, Father Christmas filling the stocking, children looking up the chimney, and a Christmas party. And do not forget a picture of a jolly girl friend in some pose which depicts to the full the festive spirit.

CAN HE SQUEEZE THROUGH?
One lamp and a little daylight, 1/25th sec. at f/5.6.

possible to produce negatives of a constant density by giving a certain time in development in conjunction with a certain time of exposure.

Artificial light is not difficult to use. The essentials are a light giving illumination over the whole of the subject and a

a cone, or better still a Photoflood outfit can be purchased. This outfit will comprise a Photoflood bulb, a lamp socket, a reflector, and a length of wire with a plug to make connection with the ordinary lighting circuit.

Using the Lights.

For really good results two outfits will be necessary, one to act as a main source of light, the other to produce high-lights on top of the main lighting. A few practical trials will show how much light to use on each subject, and the distance it should be. In the proportion of these two lights you are limited only by what your sensitive material can record.

The nearer the light to the subject, the quicker the exposure. Take care to see that the main light illuminates the shadows, and that it is slightly to one side or the other of the camera. A flat even lighting on any subject is uninteresting. For a rough guide a distance

of 10 to 12 ft. for the main light makes a good beginning. The secondary light should in this case be roughly 5 to 6 ft. away. This light can be placed in any of a number of positions—as a back light, a side directional light, and so on. Watch the positions in your subject where you wish for the high-lights to come, and move the lamp until you get the desired effect. In a great number of cases a good height for the main light is when it falls at an

angle of roughly 45 degrees on the subject. Do not get the light too low, otherwise your face or faces will lack modelling.

Watch the Background.

Another tip worth remembering is to study your background. A dark-walled room will not reflect as much light as a light wall, therefore a longer exposure will be necessary. A feeling of relief to your figures can be obtained by using a separate light for the background. The film people are fond of this lighting, and many charming results can be obtained.

The above remarks are only an introduction to Photoflood lighting, but by carrying out a few experiments and taking notes of all details one will soon find out the best lighting for each subject. The illustrations include some typical subjects which can be snapped indoors with two floodlights and a miniature camera.

FATHER CHRISTMAS IN PERSON. Two lamps, 1/25th sec. at f.4.

subsidiary light which can be placed at different angles in relation to the main light. This second light enables us to add sparkle and high-lights to the flatter general lighting. So many people make the mistake of using one light, thus producing shadows which cannot be rendered by the negative.

Remember that we want to throw as much light as possible on to the subject we are photographing, so that some kind of reflector must be put behind the Photoflood bulb. This can take the form of a white piece of cardboard bent into

SECRETS. Three lamps, back-lighting on hair. 1/25th sec., f/3.5.

EXPOSURES WITH FLASH-BULBS By A. L. M. S.

WHERE electricity is not available the most convenient, and the safest, illuminant for home photography is provided by the flash-bulb. This consists of a glass bulb, not unlike an electric lamp, which contains the necessary material for producing one vivid flash lasting about one-fiftieth of a second. The bulb is fired at the required instant by an electric current derived from an ordinary pocket-lamp battery.

Bulbs are obtainable in two sizes, the smaller costing 8d. or 10d. each, according to the make chosen, and the larger 1s. 3d. or 1s. 4d. The larger bulb gives about three times the light of the smaller, but is hardly necessary for photography in the ordinary small room.

In use, the camera is set up, preferably on a stand, and the shutter set to "Bulb." To take the photograph the shutter is opened, the bulb fired, and the shutter closed again as quickly as possible so as not to allow any image to be formed on the film by the general room lighting. Moving objects that could be photographed with a shutter speed of 1/50th sec. may safely be attempted with the flash; there is no need to pose the figures included in the picture.

For really fast work, however, a flash-gun is necessary. This is a contrivance linking shutter and flash together in such a way that the shutter opens just as the flash reaches its instant of greatest bril-

A FLASH-GUN FITTED TO A MINIATURE.

liance and closes again before the flash has begun appreciably to die away. As a preliminary guide for trial exposures when experimenting with a flash-gun, the tables on page 642 may be used, taking the factor for "light value" as — 18 for a large bulb and — 15 for a small one.

Where the duration of the flash determines the time of exposure, control of the light reaching the film has to be done by adjustment of the stop, the correct value depending on the speed of the film and the distance of the flash from the subject. The following table, which has been published by the makers of the Sashalite bulbs, will give a valuable guide to exposures made in light surroundings. It should be remembered, however, that considerably more than the minimum exposure can always be given with safety, and where possible the lens should be opened one stop wider than the table shows, or two stops if the surroundings do not reflect much light. The table is for films of 14/10 DIN.

Distance. (Lamp to Subject)	Stop. Large Bulb.	Stop. Small Bulb.
5 ft.	f/32 . .	f/16
7 ft.	f/22 . .	f/11
10 ft.	f/16 . .	f/8
15 ft.	f/11 . .	f/5.6
20 ft.	f/8 . .	f/4

Modern Miniature Enlargers

THE MULTIFAX.

THE Multifax is a newly-introduced non-automatic vertical enlarger, and is made in two miniature sizes, 6×6 cm. and 24×36 mm., as well as for 3½×2½ films or plates.

The baseboard of the 6×6 cm. model illustrated is 15½×22 inches overall, and will take paper up to 15½×16½ inches. The upright consists of three parallel metal tubes, linked together at top and bottom by a sturdy casting, that at the bottom being clamped to a stout bar below the base by a large bolt having a wheel for a head. Loosening this allows the entire upright to rotate for projecting off the baseboard to give extra-big enlargements.

The projector head is held by three grips, one round each tube of the upright, and the head is moved up and down by rotation of a wheel operating a friction drive. For focussing, the lens panel moves along a tubular support, a similar friction drive serving to raise or lower the panel, which is connected with the enlarger by bellows. Sufficient extension is provided to allow an image a little smaller than the original negative to be projected.

The lamphouse is a tall one, and will accommodate either the usual opal lamp in wattages up to 100, or a projection lamp for use when it is desired to enlarge on gaslight or slow chloro-bromide paper. An accurately adjustable centring device is fitted. The light passes through a double condenser, which is readily removed for cleaning. A ground-glass diffuser, in the form of a cap fitting over the condenser, is included in the price of the enlarger.

Film can be inserted between the glasses of the carrier either as single negatives or in strip form, and a series of masks is included for all sizes down to 24×36 mm., each mask incorporating guides for centring a strip of the appropriate width. The carrier is held closed by the weight of the lamphouse, supplemented by a strong spring, and is opened for moving the film along by turning a wheel control, which lifts the lamphouse by means of a cam.

The lens fitted is a 7.5-cm. f/4.5 Benar anastigmat with iris diaphragm, with which the maximum enlargement possible on the baseboard is 8 diameters, bringing a full 6×6 cm. negative up to nearly 20 inches square. The lens is interchangeable for one of shorter focus for enlarging from smaller negatives.

An unusual feature is that the whole projector-head can be swung into the horizontal position for use as a projector, which role it fills well when used with a projection lamp and with the ground-glass diffuser removed. In this position it can be used if desired as a horizontal enlarger, which is often more convenient than projecting downwards off the baseboard when making big enlargements. The same movement can also be pressed into service for correcting sloping verticals.

In the 24×36 mm. model a single upright only is used, round which the projector head swings for projecting off the baseboard. The size of this is 11½×16 overall, taking paper up to 11½×12½ inches. Focussing is here done by a nut on a quick thread, the bellows arrangement being retained. A single condenser, without diffuser, is used, the source of light being a 75-watt opal lamp that is automatically centred by being allowed to rest on a three-point support in the lamphouse. The negative carrier has no glass, and is designed so that the picture area cannot touch any part of the carrier as the strip is drawn through. No release is therefore needed. Same-size prints are possible also with this model, which has a 5.5-cm. f/4.5 lens with iris, and enlargements up to 10 diameters (14×9½ inches from 24×36 mm.) can be made on the baseboard.

The Multifax costs £13 10s. in 6×6 cm. size, or £9 in 24×36 mm. size. It is made in Czechoslovakia by the firm of Optikotechna, and was first imported into this country by Mr. R. G. Lewis, of 202, High Holborn, W.C.1, to whom we are indebted for the opportunity of reviewing it. We understand from him that it is now being imported by Gaumont-British Ltd., through whom it is to be distributed to the photographic trade generally.

Miniature Camera Gossip

By LANCELOT VINING.

I HAVE been asked to give my views upon the "Candid" photograph controversy, started by the Rt. Hon. Winston Churchill's letter to *The Times*. I will repeat what I wrote in "The A.P." for 24th of June, 1936, in "Candid Camera Notes": "This type of photograph can easily give offence and hurt the feelings." . . . "Your miniature camera can make many friends; don't let it make enemies."

Unless great discrimination is used by both photographers and art editors, I feel sure that this type of photograph (people at meals) so popular with certain papers will be barred by the leading hotels and restaurants, as in New York and Paris; this will not worry me, as I rarely take any "candid" unless amongst friends or sometimes at a film studio.

I will own that I was rather worried about my R.P.S. dinner photograph taken at the Monico, and gave it a great deal of thought before I sent it to the editor, feeling sure that if he passed it I had no need to worry whether Mr. Pollard Crowther was pleased or not. The night following publication I had

TESTING MODEL AEROPLANES.
Flash-gun, 1/500th sec. at f/2.8. I.S.S. film.

still uncertain about our next meeting; but he is certainly a first-class magician.

The Ideal Lamp.

By the time these notes are in print, I expect to have been to Holland and back. I am to visit the Philips Lamp Works and confer with their technical experts re the Photoflux for synchronised flashlight work; they are anxious to know what type of lamp the English photographer would think ideal, and where the present one is imperfect. The visit will be one of extraordinary interest to me.

Testing Aeroplanes.

One of the most difficult subjects I have tackled for some time was a toy factory. A yellow overhead fog put an end to all daylight before I started work, but I fortunately had two Photofloods with me.

The works cover acres and a complete tour had to be made to choose subjects.

A "CANDID" FROM PINEWOOD: FLORENCE DESMOND AND AMBROSE.
1/50th sec. at f/4. I.S.S. film.

quite a shock when I ran into the gentleman in question at the dinner of the Magic Circle; he beckoned me to follow him to a quiet corner, and there put his hand into his hip pocket. But he only produced a pack of cards, and almost whispered, "Seen this one?"

The trick over I asked him if he had seen "The A.P." He had not, so I am

In the aeroplane testing room I used my speedgun. The distance between testing bench and landing-net was very short, making it difficult to judge when they came into focus. Twice they came straight at me and hit the camera, and at other times they darted to the right or left. As may well be imagined, my flashlamps were soon used up.

TEN GUINEAS AND UNDER

A Section for the User of the Inexpensive Miniature.

The Modest Miniature at the Circus

SAWDUST and spangles and elephants and horses. Bright lights and spot-lights and the modest miniature! How well they go together.

The photographs shown were taken last year at Bertram Mills' Olympia Circus with an f/4.5 Tessar in a Compur shutter, using I.S.S. film. As photography was forbidden except to the holder of a written permit, I had applied for mine well in advance, and armed with this I walked in quite confidently without attempting to conceal my camera.

Having found my seat, the camera, a Baby Ikonta, was opened and screwed on to the ball-and-socket joint on the tripod. The focussing scale on the front lens cell was set to infinity, the Compur shutter to 1 second, and I was all ready to shoot.

Only the middle leg of the tripod was opened and this but half-way. It then

THE WIRE-WALKER. 1 sec. at f/4.5, I.S.S. film

rested on the seat between my legs, and by bracing against the back of the seat at the moment of releasing the shutter I found that rock-steady exposures of 1 second could easily be made. The ball-and-socket joint is almost an essential, because swinging over from vertical to horizontal is then only the matter of a moment, and there is no fumbling to find the other tripod bush. An eye-level view-finder is, of course, the only practical way to take this type of picture.

As regards subjects, the photographer's skill alone will decide that. The actions of the performers are easily followed in the finder and close observation will show

ACROBATS IN ACTION. 1 sec. at f/4.5, I.S.S. film.

that in practically every action there is a moment of rest either at the beginning or end, and that is the correct moment to fire. And here I would like to repeat that oft-voiced warning, "He who hesitates is lost." Certainly the chances of a fine picture are lost to the person who thinks twice before pressing the trigger.

No difficulty should be experienced in winding on the film as there is usually enough light to do this by. In any case a small torch of the "fountain-pen" type clipped in the top jacket pocket can easily be switched on when required (with its light directed downwards, of course), thus leaving both hands free to hold and manipulate the camera. M. H.

NOTE.—Although, as our contributor remarks, a permit was necessary last year for photography at the Circus, this year no such formalities will be necessary. For further information on this point, reference should be made to page 633.

THE TIGER CAGE. 1/2 sec. at f/4.5, I.S.S. film

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

ADAPTER FOR SMALL SLIDES.

Is there an adapter on the market to allow of using miniature slides (2x2 in.) in a standard lantern?

A. E. W. (Halifax.)

We do not know of any adapter specifically made to enable 2x2 slides to be used in a standard lantern, but one can very quickly be made out of plywood, metal, or even cardboard. We would remind you that using these small slides in a standard lantern would result in the projection of a comparatively small picture.

SPOTS AND BLEMISHES.

How can I avoid spots like those on the enclosed film? I clean out the camera with a brush and a vacuum cleaner each time the film is changed, and no dust is perceptible through a magnifying glass. The camera is always carried in a close-fitting oil-silk case to exclude dust, and vaseline is smeared on spool ends and prongs to trap any dust produced in winding. All solutions and washing waters are carefully filtered, and the tank is dried in a dust-proof cupboard. What more can I do to avoid this trouble?

W. W. (Working.)

The spots on your negative are almost certainly due to specks of dust, present either during exposure or development. One mark is quite evidently due to a hair. We can only conclude that the cleaning of your camera is not as thorough as you think it is, though you certainly seem to have taken very great care over the matter.

STOLEN PROPERTY.

I am thinking of buying a high-grade miniature from a private advertiser, but knowing that many such cameras get stolen I hesitate to do so lest I be offered one which is not the legitimate property of the seller. Do you think I should be quite safe in buying a camera in this way?

F. G. B. (Leicester.)

The number of stolen cameras is minute compared with the total number in use, so that although the risk is there it is extremely unlikely that you would be so unlucky as to be offered a stolen camera. But as each of these expensive cameras carries its own individual number, you can if you like safeguard yourself by enquiring, from its makers and from the police, whether they have had that particular one reported to them as stolen.

PHOTO-CELL METER.

In using a photo-cell meter for bright subjects against a dark ground the instructions advise close approach. This is not always possible, as for example in photographing a stage which may fill only half the view-finder, or a dancer, illuminated by spot-lights, in a dark arena. How is the meter used for such cases?

G. P. F. (Alcester.)

There are no definite arithmetical rules for using a photo-electric meter on such subjects as you mention. Your only course is to take into consideration the fact that the meter measures the total amount of light reaching it from the entire area which it covers. (This area should be approximately that included by the view-finder of the camera, but is not necessarily so). If the area included by the meter is four times that of the area of the bright object which you are trying to photograph, then it is clear that you will have to divide the exposure indicated by the meter by 4. The application of this principle in such cases as you mention should enable you to get all your exposures at least within the latitude of your film.

LONGER FOCAL LENGTH.

I am offered a V.P. camera with an additional (small) telephoto lens of unspecified power. What magnification or increase in focal length would you think necessary to show a worth-while improvement in the rendering of distant objects?

C. B. (Hampstead.)

We should not regard it as worth while to bother with an auxiliary lens that gave an increase of image size of less than 1½ times as compared with the usual one. For increases less than this it is usually satisfactory, and always much more convenient, to take the photograph from the viewpoint that best suits the subject, getting the image of a required part of the subject rather small on the film and then enlarging it from the useful portion of the film only. We would like to add that the use of a long-focus or telephoto lens is by no means restricted, as your question seems to imply, to the photography of distant objects; on the contrary, it finds its widest application in taking figure-studies and the like at quite short range.
